> have my machine, I find out (thru the net, so thank you to all those
> on the net) that it has all sorts of little interesting features like:
> hitting the right mouse button to grab something from an inactive window,
> hitting ALT-HELP at anytime to produce a screen dump, etc.

Page 16 of the 520ST user manual talks about the ATL HELP screen dump.

The right mouse button trick is an accidental side-effect of the code in the OS. You folks on the net knew about it before we did! If not for groups like the net, all the little goodies in the computer (which we couldn't hope to document) would ever be known. Thanks!

I just purchased my Atari 1040 ST five days ago and already I love it. There is some trouble in Paradise, however. My printer is a C. Itoh Prowriter A.P. Plus (similar to some of C. Itoh's Apple printers) that does not emulate an Epson. This means that I cannot use my printer for any kind of graphics such as with DEGAS, VIP Professional, or the regular Print Screen option of the desktop. Is there anyone out there who has written or can get ahold of a printer driver for the C. Itoh Prowriter, either that becomes a part of the GEM desktop (for print screen & VIP Professional) and/or for DEGAS? Unfortunatly, I don't have a modem but I do have Hippo-C (light a candle for me), if there is C or 68k source code available. Thank you to any kind souls

who can help me with this dillemma.

   As far as I've seen, there are two (maybe 2.5) sources of documentation for the ST. One is Abacus, the other is the so-called Developer's Kit (the extra .5 is Tim Oren's useful and accurate PRO*GEM tutorial). For some of us, paying $300 for some reportedly ill-organized documentation which is bundled with some stuff we neither want nor would use is *not* a valid option (which of course leaves us with Abacus). If the people at Atari are really concerned about the quality of existing documentation, perhaps they should think about unbundling the Developer's Kit documentation. Considering it costs about $60 for the basic Abacus set (Internals, 68000, and GEM), I'd think some accessible "official" documentation would not only help out those of us who have already purchased STs, but would make the machine(s) more attractive to potential buyers and developers (who would, in turn, produce more software, which would sell more machines, etc).
   And as for the Abacus books, yes, they are lacking in some respects. The

information is sketchy in some important places, and they make the mistake of assuming that we all own the "Developer's Kit". However, they contain a significant amount of basic information (which is, amazingly, not provided with the machine), as well as examples of working, functional code. The latest book, Tricks and Tips, contains C or ASM source code for a ramdisk, a screen dump utility (mono and color), and a print spooler. It also provides BASIC listings which will generate both the executable files and resource files of the aforementioned programs, which allows those who don't have the necessary tools (C compiler and/or assembler and/or resource file generator) a chance to join the fun. With all that and more for a mere $20, does that sound like something to "avoid like the plague"?

Anyway, I've heard that DRI is cleaning up the documentation. Are there any current plans to sell that separately?

Another hint:

The Abacus books are English translations of books written by one of the biggest German Atari Dealers (Data Becker in Duesseldorf; Becker also imports fine American cars to Germany). Many German developers think that Data Becker has better connections to Atari in America than the not even small German subsidary of Atari. The informations contained in the books are mostly from the developers documentation, only in a much better order and not so much PC specific. So think:

1. Developers documentation in English
2. German Data Becker books (1. Translation)
3. English Abacus books (2. Translation)
So don't be suprised about errors. There are many chances to make some. But:
Data Becker also publishes a magazine in which (the only in Germany) Mr. Stumpf
(German Atari leader) and Jack Tramiel himself are interviewed at Tramiels
home at a nice American (Canadian??) lake (including pictures, very nice :-)).
So we have to ask: Why are those Abacus books not better in their quality???
(Neil?)

Conclusion: The ST is great, but Atari is not even better than any other
firm in this business.

There was a blurb in either ANTIC, ANALOG, or Byte a couple of months ago describing that David Small [of magazine fame, including Outpost:Atari in the now-defunct Creative Computing] had developed a box which let a ST run Mac software, including graphics. There was only one little problem in this: to make one's ST think it's a Macintosh, it must BE a Macintosh - simple brainwashing doesn't work; you need a new brain. Basically, what he did was develop a DMA port device which amongst other things, contained the Macintosh ROMs. That's all well and good, until you recall the 'unimportant' fact that the Macintosh ROMs are copyrighted.. Last I heard, Small was waiting for some sort of response from Apple as to whether he could market the device, either by including ROMs purchased from Apple, or having the buyer purchase them from an Apple dealer. It SOUNDED good, but it wouldn't be the first time someon failed to market something along those lines..

In-Reply-To: Your message of 16 Jul 1986 1201-Edt (Wednesday).

>Shudder, horrors] You don't want to CUT THE PINS OFF the 68000, just
>unsolder them carefully, remove it, and solder in the socket in its plae.

John, I WANT to!
Your discription about removing a 64 pin IC was quite well, but...
I did that several times, mostly with success. But I also screwed up
a pcb by fighting to long with it. Especialy when you've got very small
pin wholes on double sided pcb's it happens that you can't suck out the
solder properly.
The pcb is very expensive, the price of the CPU is 30$ or less. For the
unexperienced it might be less dangerous just to cut the pins and
solder them out one by one. Even for this method you need something
to suck the wholes free. And what do you do with your unsoldered CPU?
You can't clean the pins properly, so they wont fit well in the socket.

By the way, the blitter chip wont need new software? It just uses the
traps? When will it be available?

And finally, I know there are special clip-on sockets, where there is
no need to remove the CPU. And why don't you solder the Blitter chip
directly on the CPU?

The blitter will supposedly come with new ROMs. I suspect that there
will be more than just the blitter chip and the socket for the 68000 on
the blitter board. By the way, this thing is also expected to provide
half-toning which I had always thought was bordering white lines with grey.
The idea behind this is that your eye sees less contrast between any element
of the line and the surrounding background and bloops over the jaggles on
diiagonal lines. The result is the illusion of a perfect line. My point is
that if this is to work on monochrome systems then some modification of the
viideo circuitry is necessary to get grey as well as black and white. Perhaps
the half-toning will only be supported on the color systems. Or it will
require a little bit more than sticking it in the 68000 socket to make it go.
I guess we just need more technical informationn on the blitter's projected
capabilities and installation scheme. But there appears to be good grounds
for remaining optimistic about installing one in the 520st. Could any
one at ATARI (neil?) please shed some light on any ofthese points?

The ROMs for the 520ST and the 1040ST are identical. The BIOS listing
you have is from the first RAM-loaded release of the system, not from
the later ROMs. The listing is useful in that it gives examples (e.g.
how to twiddle the ST's hardware), but DON'T expect the addresses or
code in the ROM to match your listing.

  I have been playing with ways to keep the time from being destroyed on my ST. I never turn my machine off, so I don't need battery backup, but I do want to get up after a reset without having to set the time again and again. A major culprit is the control panel desk accessory, which sets the date to noon, May 17, 1985 whether there is a time still valid in the keyboard clock or not. When I tried doing without the control panel, my time was fine as long as I had a calendar desk accessory on the boot disk. I assume what is happening is that the keyboard clock is undisturbed over a reboot cycle, and the desk accessory is setting the TOS time to that in the keyboard clock. When a power cycle is done, or when that calendar is not around, the time comes up as noon, Nov 20, 1985.

  Anyway, the control panel is 15K and doesn't work the way it should, so I was more than happy to turf it and solve the problems of not having it. One thing was that I had to write a (one line!) program to set the printer driver to expect an Epson printer for screen dumps. This preference is recorded in the desktop.inf file, but is ignored without the control panel. Curiously, the mouse and keyboard sensitivities ARE used without the control panel. To set the time, you also need a program which sets the keyboard clock time; until you power off again, your time will be fine.

  BTW, a followup from Anees Munshi said he cut the RESET line going to the keyboard. I *think* that line is only pulled low on power-up, and the reset is a non-maskable interrupt. That would explain why the time can survive a reboot but not a power-up with my method.

I have purchased the ST --> SCSI host adapter and driver software from
Supra ~$200. I was able to connect an Adaptec SC4000 SCSI disk controller
and a Micropolis 1304 (40 meg) hard drive . Guess what ....
IT worked first time !!

The Supra will work with the Xebec controllers also, I don't remember the
model numbers, but call Supra and they will tell you.

The software that comes with the package contains a head parking program,
a formating program (this program will look for bad sectors and map them out
if you select this option.), plus a boot program. The documentation
covers building a hard disk system, ex. wiring , power supply requirments,
placement of boards and so on. And of course how to get it
all running.

The Atari is limited to ~ 16 Meg partitions so I have two 15 meg and a 12
meg partitions. These are hard drive icons C D E.

The ST will not boot off the hard disk, but you can put a Auto folder on
your boot disks that has a program to mount the hard disk. This takes
approx. the same amount of time as normal boot, but the hard disk is up and
running. Its pretty wierd seeing 5 drive icons on the screen but the hard
drive I am running is bery bery fast. The drive has a 6ms track to track
seek and 30 ms average, and I am running a 4 us step.

Needless to say this a Hell of a system.

I am very pleased with the Supra adapter.
With a daisy chained 50 pin connector could you mayber hook up another
SCSI device (Tape drive for instance ..... cross your fingers.)????

I'm not so sure that such a beast exists. The 3270 series terminals

are best described as workstations, not terminals in the ordinary sense.
Like CDC `terminals', only more picky. 3270's don't talk serial at all;
they have a ridiculous protocol that involves transferring entire screen
pages, and buffered input areas.

There is no such thing as a 3270 emulator. What you need is either
a normal terminal emulator run through a front end (like a Series/One
running the Yale package) or one of those elusive Applelink SNA
adapters that purportedly came out for the Macintosh, and something to make
your ST talk Applelink.

Summary:

It turns out that the .o format IS documented - DRI CP/M 68K manual,
section 3 "Command File Format". It's similar to Unix in that the
executable format is the same as the object format, except that
the symbols have been resolved and possibly stripped out. "Relmod"
does some further processing, but this is after everything has been linked,
and I haven't bothered to finger out what it's effect is.

You can easily identify the sections of a .o file described in the
manual by using "dump.prg" on some (small) .o file. As far as I can

tell, the symbol types "defined", "equated" and "equated register"
are possibly white elephants - they're probably used as flags by
the assembler, then the whole symbol table is just dumped out to
the .o file; but, I haven't investigated that thoroughly yet, so
don't stake your life on it.

Send me mail if you want to discuss it further - I'm still exploring.

Can anyone out there (Neil?) tell me anything about the status of the
Activenture CD-ROM encyclopedia that Atari demo'd last year? Is there
any possibility of Atari actually producing it for sale any time in
the forseeable future? I had heard that J.T. couldn't get a supplier
to sell the players to him at a price that would allow him to sell it
at the price he wanted. Is that likely to change any time soon?
   I sure would love to get my hands on one of those-- and it would
send Atari's sales through the roof, too.

I've been doing some work lately on writing machine- and compiler-independent graphics code, and as a result came up with a variety of bugs for Lattice, Megamax, and Aztec compilers (Lattice and Aztec are available both on Amiga and ST; Megamax is an ST-only phenomenon). Compiler bugs are one of the most annoying facts of life that a software writer has to live with; I thought I could spare some of you some grief by listing a few of the interesting ones I've found.

Lattice: this was my favorite bug. It seems that my release of the Lattice compiler (on the Amiga, 3.03) has a very small problem in its floating-point library; if a float becomes almost equal to +/-2.000000 (in fact, if its binary is 0x40000002 or 0xC0000002) then all multiplications using it fail. Multiplying this value of -2 by itself gives -2, for example; and multiplying it by anything else gives 0. This is not a good thing for people who need even vaguely reliable floating-point math. I stumbled across this strange bug purely by chance, and it took a LONG time to track it down. Here's a piece of code to show what I mean:

```
main()
{
     float f;
     *(long *)&f = 0xc0000002;
     printf("%f * %f = %f!!\n", f, f, f * f);
}
```

If you get "-2 * -2 == -2!!" then your compiler is in trouble... and there aren't any easy fixes. Using double math doesn't help, since Lattice (bizarrely) casts floats to double just to multiply; the double killer-value is 0xc000000040000000. All you can do is pray your code doesn't hit it. Mine does, with dismal regularity; Lattice users lose.

Megamax: my version (1.0) has a little float-math trouble as well. If you have some expression whose value is 0, and negate it and assign it to a variable, hey presto! its value is -2. Thus "float a = 0; a = -a" will set a to -2. (Compiler bugs seem to like this number..) This problem at least has a workaround; if you say "a = 0 - a" the problem doesn't appear. Also a problem, and equally annoying, is that floating-point comparisons don't work very well. Try, for example, "printf("%d\n",2.0<-1.0)". It prints 1. This (you may notice) is not correct. I fixed this on an ad hoc basis in my code by checking -2 > 1.0 (which does work).

Aztec 3.20a: when I had fixed the Megamax bug, I wiped the sweat from my brow and turned to my trusty Aztec Manx compiler to recompile the altered source. What should I find but the program failing again! After more work, I finally traced it down to the expression "a[i] = 0 - b[i]" (yes, one of the lines I had "fixed" so Megamax would accept it...). It seems that the Aztec compiler has trouble with expressions of this form, where one subscripted float is subtracted from a constant and assigned to another subscripted float (it may be a more general problem, but variable subscripts at least are required). The result is that b[i] is ignored, and a[i] is assigned the constant. Why this is I don't know; my knowledge of 68000/68881 is weak but the assembler output looked ok to me. The workaround for this one turned out to be assigning "0 - b[i]" to an intermediate variable, and assigning that to a[i]. So it goes... nobody can do float math right.

Another smaller bug fell out after I had all of these in order; one of the Lattice compiler's infamous CXERR messages (#25) resulted when compiling a perfectly innocuous piece of code. It appears that Lattice has trouble accepting more "register" declarations than it has registers! Rather than ignoring subsequent register declarations, it starts handing out non-existent registers. Combining my knowledge of CXERR meanings (from an Amiga Mail issue) with the fact that Lattice only allows four address and six data register values let me fix that one, but it was an annoyance. (If anyone wants the list of CXERR meanings, let me know and I'll type them in.)

Hopefully this will help somebody, somewhere. Five compiler bugs in two days was a little too much, and hopefully some programmer can come a little closer to maintaining his sanity as a result of this posting. Good luck...

What you describe above is known as Antialiasing. In half toning a
group of pixels - normally a square group like 4x4 - behaves like one
pixel, and depending upon how many of the pixels are on you get
illusions of different shades of gray or even patterns. Of course you
loose out on resolution, but it is useful for filling type operations.

Can someone at Atari tell us if the blitter will support gray levels
too? Landon or Neil perhaps.

August 1986 ANTIC TOC
Theme: Online Communications

page article

*****The ST Resource*****

55 LINKLINE
Run your 8-bit Atari from your ST. Use your 8-bit as an intelligent printer buffer, etc. Requires making a cable.

62 ONLINE PICTURE VIEWER
A continuation of the article started last issue. You'll need that issue if you want to have the complete set of programs.

65 dBMAN
A review of this dBase III workalike. Atari Corp has just obtained the exclusive worldwide marketing rights for dBMAN. A GEM version will appear in the near future.

67 N-VISION
A review of the program that ANTIC calls the first serious competition for DEGAS. You can mix pictures with music by using Music Studio (also developed by Audio Light, Inc but marketed by Activision). Some 'clip art' graphics are included and Audio Light plans to release additional clip art disks.

71 ST Product News
SOFTWARE
Pro Fortran-77 (Prospero Software)
Hippo Backgammon (Hippopotamus Software)
Winnie The Pooh (Sierra On-Line)
BOOKS
ST GEM Programmer's Reference (Abacus Software)

75 NEW PRODUCTS
A listing of recently announced or released software, hardware and books for the ST.

*****End ST Resource****

Comments: This is a very good issue for anyone contemplating buying a modem and getting started in telecommunications. Most of the Atari specific modems and some of the generic modems are discussed as well as several telecommunications software packages. The September issue will feature an article on how to tune in weather satellite pictures on your Atari (either ST or 8-bit). My TOC should be a lot earlier for that issue. I like to beat the issue to news stand so no one has a problem finding it if they want to buy it.

I recently downloaded hack for the ST from net.sources.games. Unfortunately, my 13 year old daughter is now on my back because she can't get below level 3.

The problem is the version of hack that was posted requires double sided disk drives. I only have two single sided drives. There is a cure for this listed in the README file of hack, but it requires a file that ends with .env This is supposed to set an environment variable to allow for two single sided drives. Hack didn't come with this file.

Is it part of a shell program or just something I missed? I really don't want to buy a d/s drive just to get Heather off my back :-)

The Navy -- not just a job. its an adventure.

O.K. Neal, What's the story here. I knew that the early machines didn't socket the 68K, but what about the more recent releases/revisions of the 520? Has the RAM expansion header been added yet?

>Seems that with GDOS, the ST will become resolution independent, so
>Atari is rumored to be considering releasing a 1,024 x 1,024 resolution

I had guessed this could be done, is there a chance of getting/setting various high-res interlaced modes.

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
A number of people have sent mail asking how proff output can be sent
directcly to the printer, or to the screen. Instead of replying to
everyone individually, i am responding here.

Firstly, you will need either the new release of the Alcyon Package,
or the new versions of gemlib and libf (avail on CompuServe ataridev).
All you have to do is to re-link the objects with these libraries.
(One of the many bugs in the old libraries was that it would not
handle fopen to LST: or CON: correctly).

To get the output to go directly to the printer enter

     proff [<whatever options>] input.prf LST:

To get the output to the screen enter

     proff [<whatever options>] input.prf CON:

Summary: August for ST

This message is the culmination of a number of expensive long distance phone calls between myself, TLM Systems and Microware:

The Atari ST port for OS-9 68K has just passed Beta test. Microware is awaiting a copy of the documentation from TLM Systems and is expected to give written approval of the port forthwith. Distribution of the port to the public is now expected to begin around the beginning of August. Call TLM Systems if you are interested.

The work on the Amiga port is progressing, but it looks like it will not be near completion very soon. More than that I can't say. I can say that I have a hard choice to make whether I'm going to buy an Amiga or an ST for myself. Unfortunately the Amiga price is not at all reasonable in the Toronto area. The going price is about $2,800.00 for 256K and Color Monitor. I feel that that's at least $500.00 over priced.

I *will* be getting my own 68020 OS-9 system some time next month, however. It will be the brand new Frank Hogg QT-20X. This is a 68020 system on a motherboard which can be mounted into an IBM-PC case or a rack mounted case. It starts essentially with 2.5 Meg. and 4 serial ports. Options include memory protection, graphics and up to 14.5 Meg. expansion (yes, 14.5 Meg!) and 28 serial ports. I'll probably get a system worth about $5,000.00 to $6,000.00 US. I'm still deciding on the exact configuration. With OS-9, I'll have object code compatibility for many of my programs between the Atari ST or Amiga (whichever I buy) and the QT-20X.

Cheers! -- Jim O.

Here is a simple program to set date and time on the ST. As you will see,
the reset button does NOT cause the keyboard timer to lose its time. However,
TOS does; so you need to do Tsettime() and Tsetdate() after reset.

-------cut here-------cut here-------cut here-------cut here-------cut here--

```
/*
     td.c -- a simple program to set the time and date on Atari ST

     pm @ Case
*/

#include <osbind.h>

long td;           /* time and date, in internal form */
char tds[] = "00mm/dd/yy hh:mm:ss";   /* 00 are wasted space */
char new[20];           /* input buffer, fmt as above */

twodigits(a, p)             /* the last two decimal digits of a
     */
register int  a;       /* are stuffed into p[0], p[1]
     */
register char *p;
{
     *p++ = (a%100)/10 + '0';
     *p++ = a%10 + '0';
}

timestr(t)
register int  t;
{
     register int  sec, min, hr;

     sec = (t & 0x001F) << 1;
     min = (t >> 5)  & 0x003F;
     hr  = (t >> 11) & 0x001F;
     twodigits(hr,  &tds[11]);
     twodigits(min, &tds[14]);
     twodigits(sec, &tds[17]);
}

datestr(d)
register int  d;
{
     register int day, mon, yr;

     day = (d & 0x001F);
```

```
     mon = (d >> 5) & 0x000F;
     yr  = ((d >> 9) & 0x01FF) + 1980;
     twodigits(mon, &tds[2]);
     twodigits(day, &tds[5]);
     twodigits(yr,  &tds[8]);
}

set(p, m, i)           /* Assign bit field <i:j> of td with a
     */
register int  p;       /* computed value from new[p], new[p+1]
     */
register long m;       /* if they are decimal digits.
     */
register int  i;       /* j == i - 1 + #1's in mask m
     */
{
     register int  a, b;
     register long ll;

     a = new[p++];
     b = new[p];
     if ( (a == 0) || (b == 0)
     ||   (a > '9')|| (a < '0')
     ||   (b > '9')|| (b < '0')   ) return;

     ll = (long) ((a - '0') *10 + b - '0');
     if (i == 0) ll >>= 1;  /* couple of kludges! for 2*sec and yr */
     if (i == 25) ll -= 80;
     ll = (ll << i) & m;
     td = (td & ~m) | ll;
}

main()
{
     register int  *p;

     p = (int *) &td;

     /* \033e (enable cursor) if this prg is invoked from desktop */
     Cconws("\033e\r\nikbd current date and time:  ");
     td =  Gettime();
     datestr(p[0]);
     timestr(p[1]);
     Cconws(&tds[2]);

     Cconws("\r\n\n\
to change the time and date, type in the new values in exactly\r\n\
the same format;  to leave it alone, just type return.\r\n\
\nmm/dd/yy hh:mm:ss\r\n");

     new[0] = (char) 18;
     Cconrs(new);
```

```
    Cconout('\n');

    /* set   hours; min; sec; mon; date; year; */
    set(2,  (long) (0x0000000F << 21), 21);   /* month */
    set(5,  (long) (0x0000001F << 16), 16);   /* day */
    set(8,  (long) (0x0000003F << 25), 25);   /* yr, 20th century */
    set(11, (long) (0x0000001F << 11), 11);   /* hr */
    set(14, (long) (0x0000003F << 5),  5);    /* min */
    set(17, (long) (0x0000001F),       0);    /* sec */

    Settime(td);       /* set ikbd clock */
    Tsettime(p[1]);
    Tsetdate(p[0]);
}

/* -eof- */

While trying to compile a program using Megamax C (ported from DRI C) with
type casting changes (coercion -- a real pain).  The problem seems to be with
a pointer to a function.  For example:

long  (* ptr)()
 .
 .   code
```

 .
return ((*ptr)(var1,var2,var3))

When it gets to this point, returning the result of the jump thru the pointer to the function, it blows up. I could do this in assembly and insert it, but that is a pain...
Any answers, comments.

Thanks, Mike

It's beautyful. It's wunderful. It's .... not working as it is supposed to be. The kernel still has a severe "bug" (=design flaw) in it limiting you to certain amount of directories (including subdirectories). The effect is that the system locks up after a certain number of disc access operations. I can't believe that this should be a problem difficult to fix. To the end user it might be very annoying.

Stephan Wendl.

I was playing with the control panel recently and noticed something strange.
It appears to be constructed from an object tree displayed inside a window.
The "window" can be moved and closed. Most of the time the panel is redrawn
when it is uncovered or selected but sometimes it disappears.
However, the panel can still be displayed when there are four other windows
already on the screen. I thought there was a limit of four windows?
So, how is the control panel displayed and controlled??
Does it use a window?

Well, I hate to say it, but there is a definite bug in Megamax C. The relative
addressing did not work. When I was replacing a system vector with the

address of a routine, the relative offset from the PC was not correct, and the system would crash every time I would call the routine via (*ptr)(var1,var2,..)

Example of what I am doing...

```
long   *vector= .....    /*vector address*/
....
...
xbios(38,install);
....
...
install()
*vector=(long)routine_name;
....
...
```

basically, that is it.
The relative offset (as I examined the routine in SID) was incorrect by about 24 bytes. If anyone from Megamax is out there, I can send the source to you, so you can try it for yourself.

The worry is that you damage your board. But solder wick works astonishingly well and very quickly, minimizing heat. I have found that, having done the solder wick thing and the pin is not quite clear, a GENTLE wiggle on the pin will almost invariably free it. Yes, the wick gets THAT MUCH solder. If

not another treatment from the other side of the board usually does it.
Doug.

~~~~~~~~~~~~~~~~~\ lineater, \~~~~~~~~~~~~~~~~~~~~~~~~~~

my son came up with another solution, once the program is loaded and running
just put in a different disk (your 'library' disk) and use that to store the
level info etc., he claims that it works fine

I hope that Atari listens to the suggestions posted by this
conference. I feel that Atari should continue to keep competition
off balance by coming out with a 68020 based micro instead of
the DMA box they plan on marketing. I think that the DMA port
should be reserved for the harddisk. A 68020 machine, with
the power of a S*n workstation, could be produced for under
$3000, estimating conservatively. I also think that Atari
should come out very soon with an inexpensive upgrade to add R/W
and the additional address lines to the ROM port to maximize
the potential of the STs. Though I do not own an ST, I am very
interested in these "new" 68000 machines. (aside: 68000s at
8Mhz now sell for under $10.00)

Any info on laserprinters, CDs and the graphics upgrade for the STs
would be very welcome.

X *  Sample code that demonstrates the use of TIMER A on the 68901 MFP
X *  Also demonstrates  how to take over the process terminate interrupt.
X *
X *  WHAT:
X *
X *  The program begins by installing the address of the function
X *  'terminate' into the exception vector 0x102 (Process terminate
X *  exception, saving its old pointer. It then starts up Timer A on
X *  the MFP, configured to interrupt the function 'count' at 48Hz. The
X *  main loop continuously displays the value of a counter, that the
X *  function 'count' increments. On hitting CTRL-C, the 'terminate' function
X *  is called to handle the termination. It stops Timer A, then
X *  restores the origonal process terminate vector and
X *  returns (to the default system Interrupt Service Routine).
X *
X *  HOW:
X *  The timers on the MFP are controlled by a 2.4576 Mhz xtal (Yes the
X *  Atari Internals book is once again wrong!). Using
X *  timer 'a' in the delay mode with a prescale set at 200 (ie. by
X *  setting the timer 'a' control register to 7)
X *  gives you a 12288 Hz counter (2457600/200). Using a count
X *  of 256 (ie. by loading the timer 'a' data register with 0)
X *  you get an interrupt frequency of 48 Hz (12288/256). For other
X *  values for the control & data registers see the 68901 manual
X *  available for free by calling Motorola, or see the Atari Internals
X *  book.
X *
X *  The timer interrupt is handled by the function 'count'. This function
X *  increments the long counter, then clears Bit 5 of the ISRA (In
X *  Service Register A), and then returns from the exception by doing
X *  an RTE. NOTES: In the ST the 68901 always operates in the
```

```
X *  Software End of Interrupt Mode (ie. bit 3 of the Vector Register VR
X *  is always set). In this mode the ISR bit of the ISRA is automatically
X *  set when an interrupt occurs and the processor requests the interrupt
X *  vector. (The ISR bit corresponding to the Timer A interrupt is bit 5
X *  of the ISRA). As long as the bit is set, that interrupt and any other
X *  interrupts of lower priority cannot occur. Once the bit is cleared
X *  the same interrupt or any lower priority interrupts can once again
X *  occur. This is why it is important to clear BIT 5 of the ISRA before
X *  performing the RTE. The address of the ISRA register is 0xfffA0F
X *
X *
X *  Compile and link with gemstart.o, osbind.o, gemlib,  libf

This little "oops" just had to get some sort of reply. There are 3270 emulator packages available for the IBM-PC, two or three of which are written in "C" and possibly even port-able to the ST. In addition to the software, a very high speed serial interface, probably through the DMA port will also be needed. Specifically, the serial chip should

support SDLC and/or HDLC protocol. There are several likely candidates
including Intel, NEC, and Motorola parts. Again, the old "1 address line"
limitation of the DMA port is likely to create a bit of inconvenience.
I suppose you could call some of the makers of IBM-PC SNA adapters to see
if they have done an ST port yet. It is quite likely that at least one
of them either has already done it, or will be doing it soon.

There may also be some SCSI->SNA adapters coming in the near future, so
watch for them as well.

What is wrong with this program???

I want to write some sort of interrupt handler in TDI Modula-2 for the
Atari ST series, using the IOTransfer procedure.
Following is a small Modula-2 test program which has the same task as
the Megamax C interrupt test program, which have been posted two or three
weeks ago in net.micro.atari16. I used the TDI Version 2.10a Modula-2 compiler.
The documentation is very poor at this point, so if anybody knows a
hint how to get this program running, please mail to

uh@unido

Many thanks in advance.

   WriteLn;                                 (*.. during wait*)
END INTRTEST.
```

--------------------------cut here---------------------------------

This program bombs: 3 mushrooms (aah bombs).
But first if you hack something on the keyboard (i.e. move the mouse) when the program is ended (N is 0).

Some words about my configuration:
- 260ST upgraded to 1MB,
- SF 354,
- SM124,
- TOS in ROM.

Please, please help!!!

Lines: 34

This is a series of detailed questions about connecting an Atari 520ST to a SONY monitor/receiver. Surely, someone must have done this by now and has some advice for the complete novice.

We are trying to connect a 520ST with a 13 inch SONY monitor/receiver (model KV-1311CR). The 1311CR has facilities for both an analog RGB input and a digital (TTL) RGB input. The TTL is supposed to be directly compatible with the IBM pc. Are the monitor signal levels from the 520ST comparable to those from an IBM (i.e., TTL) or must the analog RGB connections be used?

Most other postings that I have read about this has someone using a SONY XBR monitor/receiver with the 520ST. Unlike its bigger XBR siblings, the 1311CR has a single composite sync input rather than separate horizontal and vertical sync inputs. One method for joining the two sync signals into something that resembles a composite sync signal is to attach the horizontal directly to the sync input pin and use an 100 ohm resistor for tying the vertical sync to the horizontal line. Has anyone any experience with this method? Any better suggestions for adding the two sync signals from the Atari together?

Finally, there are three pins on the analog RGB connection that control various modes (e.g., where to select the audio signal fro where to accept fast blanking). Are these pins "naturally high" (nothing illegal, just typical TTL levels) so that unless some grounding is provided, the high state (RGB mode) is selected?

If you know anything about connecting a 520ST to a SONY monitor, please send some email with your comments. Thank you for your time.

Organization: AT&T Bell Laboratories, Murray Hill
Lines: 22

We have been seeing an unusual problem with our Atari 520ST lately that someone may know about. Our 520ST has been upgraded by the dealer to 1 Mb and TOS in ROM. We also have a double sided disk drive rather than the standard single sided drive.

For certain disks, the console appears to reset itself while reading a disk. This reset is equivalent to manually depressing the reset button on the back of the console (i.e., the monitor blinks and the disk drive begins reading the disk again). I have not yet established any pattern to this problem. It happens on some copy protected game disks and on disks with TOS files (e.g., the TOS disk). This problem is intermittent, and since it doesn't happen consistently, I suspect the problem is mechanical (disk drive timing, crossed wiring in the console). How could poor drive timing cause the console to reset itself?

Any suggestions? Email would be appreciated. Thank you.

.
I just got the information sheet on MWC for the Atari ST. I thought I would
share some of the info with the net. The package includes:

1- a pretty complete looking C compiler (cc for one step compilation)
2- linker
3- assembler

4- a lint-like error checker
5- a symbolic debugger (no csd)
6- a fair looking command shell
7- microEmacs
8- make
9- an archiver
10- egrep
11- sort
12- diff
13- cmp
14- pr
15- tail
16- uniq
17- wc
18- 600 pages of documentation

It is available now for under $200. Their number is 312-472-6659 if you are
interested.

[]

Yes, nobody seems to get floating-point right!!

I am very disgusted because I'm into scientific computation.
I am very anxious to see a FP chip connected to the ST!!

I am here reposting a fix to the Megamax FP comparision bug.
Since I've done this it has worked fine. But beware: Megamax
gives you NO error messages upon division-by-0 and similar
errors - you just get garbage, and occasionally crashes.

I took a close look, using the mmdis disassembler,
at the double.o file (extracted from the double.l library with
the mmlib program.) Only one (1) byte is wrong, looks like a typo.
In the routine _fcom, where it says BSET #31,D1 it should say D2.

To patch it, use the following 'bth' and 'htb' programs:
Bth.prg translates the bytes of any file into both hex and
ASCII representation. The output can be edited on any text editor,
and then fed into the htb program to get it back
into binary. (Only the hex part needs to be changed, the ASCII part
is treated as a comment.) (Yes, Virginia, there is no way to assemble
the output of mmdis!)

In this case, tell bth.prg to read double.l. In the output file,
look (on line 47) for the sequence "46 82 46 83 08 C1".
Change the C1 to C2. Run it through htb.prg to create newdbl.l,
and your done. From now on, mmlink yourprog.o newdbl.l.
You can fix the single-precision float.o in syslib the same way -
look for the same sequence and do the same change.

```
/* BTH - a program to create a hex file from a binary file.
   by Moshe braner, 860613.
*/

#include <stdio.h>

#define  hinibble(b)  (((b)>>4) & 0x0F)
#define  lonibble(b)  ((b) & 0x0F)
#define  tohex(b)     ((b)<0xA ? ((b)+'0') : ((b)-0xA+'A'))

main() {
     register int c, b, i, t;
     int  n, m;
     FILE *infp, *outfp;
     char infname[80], outfname[80];
     char col[16];

     printf("\n\nBinary To Hex conversion program.  MB 8606.\n\n");
     printf("Enter name of source file: ",stdout);
     gets(infname);
     /* open file with "br" to avoid skipping of '\r's
        by Megamax library
     */
```

```
     if ((infp=fopen(infname,"br")) == NULL) {
          printf("cannot open source file!\n");
          exit(0);
     }
     printf("Enter name of output file: ");
     gets(outfname);
     if ((outfp=fopen(outfname,"w")) == NULL) {
          printf("cannot open output file!\n");
          exit(0);
     }

               n++;
          }
     }
     printf("\nWrote %d bytes.\n", n);
}
-------------------------------------------------------------------
```

Another Megamax bug: after you open a file for reading using fopen("r"), you SOMETIMES get some extra garbage at the end of the file. It is some characters that appear near the end of the file, repeated in a garbled order. I got around it by using fopen("br") and doing the CRLF-->LF conversion myself.

While we're at it, did anybody find out how to get IO redirection to work right for C programs compiled with Megamax and used under Micro C-Shell? (Even though it works when using a program as .ttp from the desk top, the same program when invoked from microcsh as "progname > outfile" gives two bombs.) Somebody from Megamax posted a claim that it works, but it does NOT! (I use a 1040STf, completely off a (RA)M-disk. Monochrome.) I wrote Megamax (twice) and Beckemeyer, but got no answers. I also wish microcsh was not so DRI oriented - e.g. 'echo' is a separate program on disk, but a DRI-specific 'cc' is taking up space in the microcsh core. How about having an environment variable that tells microcsh which compiler is used? (and activates the appropriate IO redirection scheme...)

Keywords: version for ST
Summary: For ST?

Hi. I know that there is a game in public domain called GO for Macintosh.
Is there a version for ST for the game? Can you tell me how I can get it?

Thanks. (in advance)

Daniel.

While we all admire what Atari has wrought with bringing the price of
68000 machines down to earth, your $3000 number is a bit absurd. Mostly
because the monitor alone to display 1200 X 800 monochrome graphics is

on the order of $1000 wholesale. Add to that the $200 price of *each*
68020 chip, multihundred dollar price of 68881 chips, 4 Meg of ram
(which at $3 per 256K chip is still $384) Add to a new box, bigger
power supply, you have to include a hard disk to make it run at any
speed. No, I don't think $3000 will buy you a Sun workstation ($8000
will :-)) I think the best that can be said is that in 5 years it
will probably be possible. Ah well.

Anyone seen a GEM version of VIP Professional yet?

Any other good spreadsheets available? (I discount Kuma's K-Spread,
which is clumsy and limited).

Actually, with its dynamic bus sizing and cache, it is simple to make a board with some 32 bit memory (optional but desirable) and a 68020 to replace the 68000 directly. The 68020 can detect that the memory is only 16 or 8 bit as it selects it, and use more cycles if necessary for the data being accessed. This makes it the most drop-in-able of 32 bit micros, it could go into the 800xl or such, and address all the little guy's memory and peripherals as part of its address range. It should be an addin, not a followon only.

Does anyone out there know what is included in the TDI Modula-2 developer's package beyond what is included in the basic language package? Come to think of it, what's included with the basic

language? I'd appreciate comments from anyone with experience
using either version. How about developer's packages in general;
are there any out there worth the cost?

We are considering replacing the TI-9900 micros in our lab (used for our Computer Organization class) with a 68000 based machine - probably an Atari ST. We have found it most effective to have the students edit on the University Unix machine and download code to the micros. We have a cross assembler on the Unix system and they down load object code.

An Atari ST is a real machine with several assemblers available. I have not seen source in C for such an assembler. Ideally, we'd like the source for a 68K assembler in C so they can get the syntax mistakes out on Unix, download to the Atari (or whatever we use), and then use the SAME assembler to assemble the executable program.

So - is there a PD 68000 assembler written in C that produces executable code for an ST that could be ported to be a Unix cross assembler?

.
     The floppy disk on my ST seems to run very slow. I have seen this on other STs, so I think it is a design flaw. If I am not imagining this, where does the fault lie? Is it the disk, the controller, or the software? Will there be a fix for this from Atari?

Could someone tell me how to find out what public domain software is accessible from BITNET? I am limited to using kermit from an IBM machine here at Cornell. Is there some library or kermit server out there that I could access? Thanks very much.
ps. I got my 520st on the weekend and it looks great on the monochrome monitor and surprisingly good on my color tv. My dealer says that Graphikon (sp?) will be releasing a new terminal program in the near future that supports vt202, REGIS, and tek4104 graphics modes. This could be the terminal program I am waiting for.
                                peter lorraine qbzj@cornella.bitnet

Read the description of the single sided disk format and found it quite
informative. Would someone expand on that and describe how a double sided
disk is laid out?

Hello.

A friend has asked me to seek out for him a microcomputer program to do
stock market analysis, projections, etc. Just what type of microcomputer
the software runs on is not so important; he will make his purchase
based upon which has the best stock market software.

Can anybody recommend any such software? A little about what each one
does would be nice, seeing as I know *nothing* about stocks and I'm
going to have to pass along to my friend the responses I get. Maybe
if I find something sufficiently neat, I'll get into it too! Of course,
that requires money... ah, forget it.

Anyway, thanks very much in advance for your time. Sorry this message

has such a "generic" quality to it; I'm sending it to a bunch of PC
oriented bboards (sorry also if you've been forced to hit the "N" key
several times as a result of this!).

Please respond to me personally, as opposed to on this bboard, since I
don't normally read micro-oriented bboards.

Thanks again.

The regular version of TDI Modula-2 (release 2.00A) ($79.95) includes:

- GEM based editor
- compiler
- optimizing linker (removes uncalled procedures)
- its own desktop that allows edit/compile/link of files by
  merely clicking on file icons
- a desk accessory that sets the search paths for the Modula-2
  system, heap size and some other compile/link options
- modules that provide full interface to GEM DOS, AES, VDI,
  BIOS and XBIOS
- 370 page manual

The developers version ($149.95), in addition, includes:

- symbolic debugger that uses GEM windows

- source file cross referencer
- symbol and link file disassembler
  symbol file decodes to give a definition module and link file decodes to give code in 68K assembly language
- Megamax resource construction program

The editor is GEM based but also makes use of function keys. It is quite slow both in editing and reading and writing files. It makes use of error files produced during compilation to flag errors. When the cursor is at an error, a short description of the error is displayed.

The optimizing linker is a real improvement. It is not unusual to get a 75% reduction in the size of the final program. With optimization, the final code size is comparable to that produced by the Alcyon C. (Your mileage may differ.)

The Modula-2 desktop facilitates the edit/compile/link cycle. Files are represented as icons and are separated into 5 categories (DEF, IMP, SYM, LNK, PRG). Clicking on the definition or implementation icons invokes the editor on the source file; clicking on the symbol or link file icons invokes the compiler and clicking on the program icon invokes the linker (if the link file is not present or is out-of-date, the compiler is called first).

There is space for 4 search paths each being a maximum of 15 characters long. I think that both of these are severe limitations. You can't go very deep into the file structure unless you have really short directory names.

The symbol and link file decoders are useful in finding compiler bugs and bugs in other people's programs.

Speaking of bugs; there are already updates for a few of the I/O modules. I've also found one in the XBIOS module (using the link file decoder, of course). Sometimes I think that WE are the beta testers.

The manual contains no documentation on GEM, AES or VDI.

Hi; about a month ago Bernhard Nebel from BITNET announced a version of Kermit for the 520ST (GEM Kermit). Is there anyone on the net who would be willing to make a copy for me, provided I send a formatted disk? Bernhard has offered, but I think it would be faster if I could get it from someone in Conti-U.S. Thanks for any help.

I have an ATARI 520 ST from Nov 85 and bought a SUPRA 20 MB Hard Disk.
First Problems (I couldn't start programs which were sited on the harddisk)
were solved by changing the GLUE-Chip of my ATARI to a newer version
(seemed to be a timing problem).

Like that it worked quite well with one exception:
Every couple of days it happens, that a file on the harddisk cannot be read.
The message "No response from drive C, check connections ..., cancel or retry"
appears every time you want to read, copy or even delete this file. The problem
never arrives during writing, but always with existing files. The only
solution is to reformat or zero the hard disk.
I tried a little bit with a ATARI 1040 ST and it seems to me that this problem
doesn't arrive there or it arrives at least less often.

So the problem might be a timing problem may be also of the ATARI?
Have you heard about similar problems and/or know possible solutions?

(BTW, this is my second attempt to send this letter, first letter returned 28 times from 28 different places. All for the same reason, somewhere the name "info-atari16" in the TO line was changed to "10003info-atari16" or "1000311654".)

Hello,

Just got my copy of THUNDER from B.I. I am very impressived by this product, worth the money. So, run out and get it.

On B.I.:

I went this past tuesday to Boston University for a product demostration of the new B.I. ST products. The president of the company himself, Mr. Michael H. Reichmann was there to demo the products. Well, I must first of all thank him for doing such. He turned out to be a very courteous gentleman who knew what he was talking about.

I am sorry I didn't take notes on it all, but this is what I can recall. He showed THUNDER, and HOMEPACK along with several others. First of all, they are very good programs. Homepack looks very good. Degas Elite he was not allowed to show by his lawyers, but he detailed it. It will allow up to four windows, 3d rotation of objects, clip_art (like a Mac!), and full color shading. Tom spent 8 months working on this baby. Anyways, he also showed I*S Talk. If you need a terminal for any use, get this. It is bug free, not like Flash, and it allows full cut & paste like Red_Rider on a Mac. VERY NICE, it also has a miny THUNDER built in. (BTW, Thunder is a 50,000 word spelling dictionary). He showed BTS spreadsheet (BTS = Between The Sheets). Looks very good, and some other stuff. I am very impressed with the overall quality of the graphics.

Paperclip Elite is not finished, he revealed. They are waiting for Atari to ship them GDOS (Neill?). But as soon as they get it, it will go out. (Some time this fall). It is basically a 1st Word with GDOS (fonts and stuff like on a mac). It also allows to merge graphics from DEGAS and DEGAS ELITE (use clip_art to make logos!) It also has thunder built in.

He also rumored that BI is planning a terminal program that will do multiple emulation. From VT220, Regis Graphics, to Techtronix 1040.

Not much else. But he did talk about the BLITTER chip. Which should be out at the end of the summer. (Or so he claims Tramiel himself told him). From what I hear, it is a board that you will plug into the socket of the 68000 in the ST, it has the blitter chip on it. You then plug the 68000 into it) Sorry for those with a 520ST, only the 1040ST has a removable 68000 chip.

Seems that with GDOS, the ST will become resolution independent, so Atari is rumored to be considering releasing a 1,024 x 1,024 resolution monitor. One source mentioned that it will also have 8 colors. I dunno.

Well, that is all I can think of, I have other net mail to update. (Like Kinmail, heh)

>seen it, or even better used it already? If not, does anybody how long it
>will take until version 2.0 shows up?

I've had my copy for the last three weeks. It's really great; the horrendous
problems which the original version had with pathnames involving
subdirectories have been completely eliminated, and the Modula desktop is a
real convenience (though it still has a couple of annoying quirks). The
documentation is *much* better, and, all in all, it's a real improvement.

The developer's version costs about US$70 more, but it's worth it: you get
the ETHZ post-mortem debugger, and the Megamax Resource Construction Set.
This latter is a big win over the DRI one: for one thing, it works, and
for another, it generates Modula-syntax header files.

The only thing is that TDI still seems to have problems in the shipping
area. It arrived (via UPS second-day service) three weeks after they assured
me all back orders had been shipped. I never bothered to track it down,
so the fault might have been TDI's or UPS's.

The July issue of Byte mentions a new C system from The Mark Willians
Company for the Atari ST. This comes with a full C compiler,
libraries, shell, etc. for $179.95. Has anyone seen this (or know
how good Mark Williams Company compilers have been on other
computers)? How good is the system and how does it stack up to other
compilers (like MegaMax) currently on the market? Any information
anyone can give me on this would be appreciated.

I almost dare say that my enhanced version of microEMACS is
done. It includes built-in help, complementing-brace search,
paragraph reformatting, and many smaller improvments.

The Atari ST version makes extensive use of the function keys,
both labelled (e.g. Help, Undo) and not (F1-F10). Access to
the alternate character set (MSB set) has been added, too.

If you send me a (3.5", single-sided, Atari ST formatted)
disk in an appropriate SASE I will return it with both the source
code (in C, about 175K) and the executable version (compiled with
Megamax, about 43K). The source can be compiled on UN*X, CP/M,
MSDOS and VMS, too.

The Proff formatter is a nice companion to microEMACS, if you
don't insist on wysiwyg. (Proff is a dot-command sort of thing,
complete with variables and macros. If you want wysiwyg I don't
see what's wrong with 1st Word. Most printers won't print fancy
fonts except as ugly dot-matrix graphics. And I think
shadow-outline is illegible... Anyway, you don't have macros
with parameters to save you typing in wysiwyg editors. And the
Proff text can be sent over to a UN*X system and itroff-ed to a
laser printer.) I finally compiled Proff (the source is public),
after adding some pointer and register stuff for speed and
smaller size. The resulting 37K file formats proffman.prf (some
32 pages of output) in 25 seconds (reading from and writing to
a ram disk, of course). If you want it too, say so.

[+]

Hello All!

In response to the question about setting up a battery backup to the
ikbd (intelligent keyboard) clock:

My experience has shown that when the RESET* line is
pulled low while reseting the ST, this -ve edge
propogates to all the chips listening to the RESET* line
(the ikbd chip being one of them). This causes the
ikbd chip to reset, and in the process of going through
the reset, it sets the time to some magic date in 1985.

Is this true, or is something else changing the time.
I cut the RESET line going to the keyboard, and now
I don't lose the time across resets which seems to indicate
that this is indeed the problem. However, I don't recommend
doing this because it will void your warranty, and if there
is a better solution, your board will be marred for life :-)
Mine is so hacked beyond recognition that one more hack ...

If you can't get a copy of uudecode, maybe it can be reposted?
It might be a good idea to cross-ref it to net.micro as well.

In reguards to kermit. It is important to make sure that you

"set file-type binary" on unix kermit.

If you are using multiplexers such as micoms, you may need to
lower the baud rate before you connect/login.

Be sure you check the status on the ST side to make sure there
are no nak packets.

there seem to be some problems with unix kermit, or features,
that make transfers a little less "automatic" than other kermits.

Some versions of unix-kermit can run in 8 bit no-parity mode, and
the non-unix kermit can be set the same way. I don't believe
this is the default.

Summary: Would you believe almost 19200 baud analog.

In article <1207@mhuxo.UUCP> gjphw@mhuxo.UUCP (WYANT) writes:
>
> While considering the purchase of a 1200 baud modem, I began wondering
>if there is some optimum data rate for modem operations over the U.S.
>telephone lines. I have seen a few advertisements for 2400 baud modems,
>and read mention of 9600 bps modems becoming available. Where does
>the retransmission rate due to lost bits negate the higher data
>transmission rate?
>What might serve to be the most efficient data rate
>using ordinary (unconditioned) telephone lines?

Well let's first consider the theoretical maximum.
The yellow book indicates that the analog value of the line will be
"polled" 9600 times/second, and a dynamic range of 64 db can be
represented in 1 db steps (7 binary bits, but only six are "reliable").
So in theory, you could jam a d/a converter and get nearly 23 Kbaud.
Of course this isn't quite reliable for real communications, and
the phone company might have fits. This technique has been used
for several "illicit" perposes, most commonly fooling the phone
company into thinking you got a wrong number, when in fact, during
the few seconds you were connected, you had sent a 3 page report. :-).

Now, to be legal, the fastest legal standard is the V.33 or "Trellis
Coding" standard. Most modem makers are combining this with mnp
protocol, and a relatively standard version of compression.
In addition, the mnp error checking can be shut off for situations
where external error checking is needed (long modem->computer lines,
multiplexors,...).

Vanilla V.33 give a generic full duplex 9600 baud rate, with reasonable
error rates for "terminal mode" types of transmission, where a lost
bit doesn't cost too much. The compression nearly doubles the data
rates in many situations, but multiplies the effects of errors. The
MNP protocol allows error detection/correction.
Most of these modems also "double buffer" the line, allowing synch or
asynch in, and synch or asynch out. This is necessary because after
compression and error checking/correction the rate can vary from
19200 baud in "perfect" conditions to as low as 10Kb in "very noisy
conditions" (including data that won't compress nicely).

>Would the long distance
>digital telephone trunks be a more serious limiting factor than local or
>short haul analog lines?

Actually just the opposite. The distance to the pcm converter provides
the greatest possiblity for LC filtering, standing waves, ringing, and
several other problems. The digital lines are very easy to get good
repeaters for, and the loss of a millivolt can be recovered. Not so
on the analog lines. Even in trellis coding, a millivolt or an extra
pf on the line can mean a 300 baud drop in speed.

Let's hope that telephone companies can get ISDN (digital/analog)
services available at reasonable rates. Then we can talk in terms
of 56 Kb/line, over multiple lines if desired. It would be nice
if a parallel modem interface, rather than serial was a valid option as
well.

>

Does anyone out there have any experience with MIDI software?
Does anyone out there have a Yamaha DX7? What kind of price did
you get on your synth? I am especially interested in software that
lets you program voices and MIDI commands and send them to the DX7,
like DX Droid. I have as 1040ST.

This should hopefully enable us to prune some of the dead
addresses from the atari mailing list.

Ditto! Please?

Wouldn't it be possible for the moderator of the mailing list to send out his address, so all subscribers can send a message directly to him? If not please add my name to the mailing list as well.

I should be getting a 520st this weekend (47st Photo at 495 dolars) and would appreciate any response to a few questions. A few people on the network were discussing the AVATEK (sp?) 1200 baud modem a while back.

Does this connect to the serial port? Also, are the terminal programs
available port-specific? That is will the same terminal program that
I could use to connect to the serial line in my office also be used
with a modem with a parallel port? Or is this inexpensive modem a
serial device? Also, is there someone in the Ithaca NY area with a
copy of the starter kit?
         thanks in advance,

>removable 68000 chip.
>
This is news to me, I recently cut the CPU from my 1040, then replaced it
with a fresh 68000 (in a socket, of course)...
I have never heard of an ST that came "Pre-Socketed", but it is quite a minor
and inexpensive operation(<$10US), and requires only a minumum amount of
skill... I would hate to see al those 520 owners left without such a great
board over something so relatively minor as a non-socketed chip...

The Avatex 1200-baud modem comes with an RS-232-C serial port, which should work with any computer which supports a serial RS-232 port. The Avatex modem has a bank of switches on the back which allow you to "assert" (set to logical "1" or "true") several of the standard control lines such as DATA TERMINAL READY (DTR) or, alternatively, let your program control them. What this means is that if your program does not set these lines up properly, you can still get the modem to put out a carrier by setting the switches properly. I found this handy with my Atari 800XL when one of my terminal emulators didn't seem to turn on the carrier. I now routinely leave DTR asserted by the modem switch, as I am not likely to turn on the modem without the computer.

I don't know much about modems with parallel ports. Usually the port controller does the conversion to serial, not the modem itself, I thought.

The otherday Rick Flashman cited the president of Batteries Included
as having said that the blitter upgrade to the 1040 would be accomplished
by removing the 68000 from its socket, plugging the blitter board into the
socket and then remounting the 68000 on the new card. Are there any
hardware differences between the 520 and 1040 that would prevent yu
from cutting the pins off the 68000, soldering on a socket, buying
a new 68000 (what are they... $20?) and installing the blitter board. My
understanding was that the footprints were very similar. The only problem
with this upgrade path might be a lack of sace within the case of the 520
or possibly the power supply. It wouldn't be much fun to do, but it sure
sounds easier than the memory upgrade. It sure would be nice to get the
blitter on a 520st. Anyone have any useful technical information to add to
this?

Keywords: xbtimer, help

```
C: void xbtimer(timer, control, data, vector)
   int timer,control, data;
   logn vector;
```

This function allows you to start a timer in the MFP 68901, timer
is the number of the timer in the 68901. Timer A:0 Timer B:1 ect...

The other two dat and control are placed in the data and control
registers. The long parameter is the address of the interrupt routine.

I really think it would be more useful in assembly then C, but since I
don't have an assembler to use this I can't.

Even the developers kit doesn't document the format of ar68 files.

I would very much like to get this information myself. Since ar68 doesn't
work (half the time it gives: error reading file ... messages, always gives
this for any file with file static objects) I am hoping to right my own.

Some other questions:

Is there any way to give the kit's linker a file list longer than 128 chars.
I tried the [com[tail.lnk]] option but it seems to truncate that to 128 chars
also. ar68 heaved it's guts on almost every module for this project.
Has anyone figured out what ar68 is doing wrong?

This was my solution:

link68 [u]
h.68k=gs,a,b,c,d,e,f,g,h,i,j,k,l,m,n,o,p,q,r,s,t,u,v,w,x,y,z,0,1,2,3,4,5,6,7,8,9,g
l,lf

where a-z and 0-9 are files renamed to a.o b.o etc.
and gs is gemstart.o renamed and gl is gemlib renamed and lf is libf renamed

Does anyone know how to pass an environment to a program? Without the

aes/vdi kludge package if possible.

Note: I was promised an update for my developers kit around april. I still have not seen hide nor hair of it? Listening Neil@ ?

Well, I've been using Lattice C 3.03 on an Amiga for over half a year (almost
as long as its been available). I could send you the book on it, though I
hear that the book is basically the same as their PC implementation. The
Lattice package contains much of the simple UNIX compatibility stuff,
though it is missing some of the more advanced UNIX packages that are
available on most UNIX systems these days. Lattice had a reputation for
compiling slowly (TRUE) and for being overly large (somewhat TRUE). The
problem with it, though, is more the way they organized their linker library
than anything else. All-in-all, things port to the Amiga at least as well
as anything I've tried to port from UNIX to something like VMS, and usually
much better. The rumor mill says that Lattice is due for a new release
soon, with a linker library more suited to the Amiga's linker and a
compiler capable of producing more efficient code.

Keywords: Atari, ATR8000, drives, sale
Xref: watmath net.micro.atari8:338 net.micro.atari16:1331 na.forsale:632
net.micro:15093

The following stuff is available for sale:

1) ATR8000:
64K, with CP/M. Has an RS232 port, a Centronics (printer) port, and disk-drive port. In the Atari mode the rs232 and printer ports replace the 850 interface, and the disk drive port allows generic disk drives to be added in addition to regular 810/1050/Indus etc. drives. I've used 2 Tandon 100-2 drives (double sided, double density 360 K each) in addition to a 1050 and an Indus. The ATR also provides a 48K printer buffer (built in in Atari mode). It works with all the old Atari machines.

In the CP/M mode, it is a full CP/M machine using the ATARI as a terminal. The full complement of CP/M software can be run (Wordstar, Turbo Pascal, ZCPR3, Dbase II, etc.) You'll get the 80 column cartridge which works if you have a black&white TV or a monitor (works great on a commodore 1702). Plus, of course, all the software you could possibly ask for: all the stuff mentioned above, plus Mbasic, Smodem, tons and tons of utilities, C compilers, assmeblers; you name it.

It is also possible to add an MSDOS board (IBM PC compatibility without graphics) to the ATR, or use it for a hard disk for the Atari.

2) Two Tandon 100-2 double-sided, double density drives. The drives are in cases, with power supplies, and are in pefect working condition and perfectly aligned. They come with all necessary cables.

3) A 1200XL and 835 modem; no big deal, but useful for spare GTIA's and ANTIC's; plus Action!, BASIC, a few zillion games, utilities, Atariwriter, lots of telecommunications stuff, and more. Good for giving the kids their own machine to fight over and call BBS's with...

For those who would like more info on the ATR8000, check out BYTE, December 83, page 329, or ANALOG's july '86 issue for a descriptive article.

As far as prices are concerned, I'll accept anything reasonable (be bold, make an offer!). I'm primarily interested in getting the equipment out because I simply can't afford to spend time with it any more. It is a lot of fun to play with, but I do have to graduate.. For a reference on list prices, the ATR used to list for $500.00, and the disk drives now go for $100 each for a bare drive, + $75 (approx) for case and power supply. Offer whatever you can afford, I'm very flexible on pricing. Please reply to

Is there a way to replace the MFP interrupt service routines with a user written version? I've been looking for a table which contains the address of the ISRs, but haven't been able to locate it.

Is the BIOS in a different location in the 1040ST? I have the ST internals book and the BIOS listing doesn't seem to be correct for my computer.

Shudder, horrors! You don't want to CUT THE PINS OFF the 68000, just unsolder them carefully, remove it, and solder in the socket in its place.

Removing an IC is not a picnic, but it can be done successfully with the right equipment. One needs a low-wattage soldering iron such as an Ungar, designed for PC board soldering. Also a "Solder Sucker" or "Solda-Pullt" or some such device which acts as a micro vacuum cleaner to suck the solder out of each PC board hole into which a pin of the IC to be removed is inserted and soldered. You heat each "pad" as the area around the hold is called, and often it paradoxically helps to add fresh solder, mostly for the effect of the fresh flux. If the exhortation "strike while the iron is hot" ever applied, it does here. While the solder is freshly melted, and helped along by the fresh solder flux, apply and activate the vacuum device and slurp out all the solder you can get. Remove the heat as quickly as possible. If it didn't work, let it cool a bit before trying again.

Another method that can be used is a "solder wick". This is a tiny strip of woven copper wire which has lots of surface area for its size. Melt the solder and touch it to the pad and it will soak up an amazing amount of solder by capillary action. I have found that solder wick works best for final removal of solder, after getting the bulk of it with a vacuum device.

Yet another trick that is often useful is to clean off your soldering iron and apply heat with it from BELOW the board, with the soldering tip offering a downhill path for solder to flow away on. This seems to work best for removing excess solder from the pad if it is NOT TOUCHING the IC pin.

The final trick that sometimes helps is heating and blowing through the hole, either just with your lips or with some kind of tube or -- best of all -- compressed air gun. The problem with this is that it causes little blobs of solder to fly all over the place -- that's why the vacuum approach is better if it works.

When you have cleaned out all the solder you can, you can usually start prying the IC out gently. Sometimes a few pins will still be sticking to the board with a light coat of solder. You may need to re-heat these, or you may be able to free some of them with tweezers or an Exacto knife. At this point, you are on your own, but you will probably be able to work out a solution. Heating a pin and prying the IC usually gains you more ground each time than you realize until the IC finally pops out easily.

My advice to anyone attempting to remove an IC for the first time, especially a big one like the 68000, is to follow the Golden Rule: "Never Force Anything"

-- following this will probably enable you to get the 68000 out intact and in a reasonable amount of time. Also, be sure you have the right equipment --a rule which will save you a lot of grief not only in this situation but many others involving electronic equipment as well. Don't attempt to do such a task until you have the right equipment (solder sucker and solder wick and low-wattage iron and fresh roll of Ersin 60/40 solder and tweezers etc.) Don't apply heat too freely. Do all of this and you will probably do OK.

There is a new working version of ar68 that is available via Compuserve. You might
want to call Atari and have them send you a copy if you aren't a subscriber to Compuserve.

In article <2198@ihlpg.UUCP>, tainter@ihlpg.UUCP (Tainter) writes:
> Is there any way to give the kit's linker a file list longer than 128 chars.

Sure. LINK68 can handle *many* files, to wit:

```
foo.68k=bar.o, baz.o, bletch.o,
argle.o, bargle.o, this.o, is.o, a.o,
silly.o, list.o, of.o, names.o, all.o, ending.o,
in.o, a.o, period.o, and.o, a.o, letter.o, o.o
```

Just put a newline wherever a line would exceed 128
characters; that's probably your problem.

>   ar68 heaved it's guts on almost every module for this project.
> Has anyone figured out what ar68 is doing wrong?

AR68 (as shipped with the developer's package) simply
doesn't work. A working version is available on the ST
Developer's SIG on Compuserve.

> services available at reasonable rates...

Hold not thy breath over the "reasonable rates" part. Most residential
users don't need ISDN, and the phone companies tend to be under a fair
bit of pressure to make as much money as possible off other services to
keep the residential rates low. IDSN will be a "premium", "business"
service, and will be priced accordingly.

> Even the developers kit doesn't document the format of ar68 files.
     The documentation that comes with the upgraded develeopers kit
specifies all sorts of file formats, including ar68. The format is as
follows:
     The first word is the Magic # 0xff65
Then each constituent file is preceded by a file header
     char fname[14];
     long modti   last mod time
     char userid
     char gid group id
     int mode mode word (see Fattrib)
     long filesize   size of file

     <filesize bytes>

     .. and so on

>
> I would very much like to get this information myself. Since ar68 doesn't
> work (half the time it gives: error reading file ... messages, always gives

     A working version of ar68 is available on CompuServe
     developers sig and comes with the upgrade too.

> Some other questions:
>

>
     The continuation character is '\' so lines can be as long as
you wish. tail.lnk can contain lines continued with \ too.

The alternate linker lo68 is avail. on CompuServe too. At least it
understands paths.

> Does anyone know how to pass an environment to a program? Without the
> aes/vdi kludge package if possible.
>
     See Pexec() the third arguement is the environ ment. In the
called program the address of the environment can be accessed via the
base page (i don't offhand remember the offset into the basepage).
The format of the envoronment is
     <string1>\0<string2>\0 ... <stringn>\0\0
where each string is of the form
     NAME=VALUE
The default environment set up by the OS is null.

Not that if you stuff your envrionment into the buffer set up by the
OS before invoking another program, its total lenght (including all
the \0's) cannot be >20, as that is the size of the buffer allocated
by the OS. But using Pexec() you can set up any length environment you wish.

> Note: I was promised an update for my developers kit around april. I still have
> not seen hide nor hair of it? Listening Neil@ ?
     It has been avail. now for quite a while, by send $20 to Atari
C/O John Feagans.

> --j.a.tainter
Hope that helps

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
Another point:
    The routine designated in the vector must return using RTE and
not RTS, as it is handling the intr.

    Assembly can be imbedded in alcyon C by using the asm
construct like:

    asm("rte");

so you don't really need an assembler to force an RTE. I'll try and
dig up some samle Xbtimer code that i once wrote.

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject:	millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject:	millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

First; almost ALL of the 1200 baud manufacturers, esspecially the onces
who first designed them, offer 2400 baud modems. There are many available.

>and read mention of 9600 bps modems becoming available. Where does
>the retransmission rate due to lost bits negate the higher data
>transmission rate?

Yes, there are 9600 baud modems out. Two major manufacturers are marketing
them (net- help me with the names!). From the articles that I have read
(PC World, BYTE, MAC World), the modems use a mathematical coding scheme to
encode the data to acheive an equivilant 9600-baud thoughput. Then, they
adjust themselves by testing the line and determining the optimum speed --
they will drop to lower rates (8400, 5600, 4800, etc) in a continuously
variable manner to get the maximum speed realiably. Because of this constant
variability and change, both ends have to use the type modem from the same
manufacturer, unless of course you set the modems to use the industry standard
speeds of 2400, 1200, or 300. These modems, if I remember right, are Hayes
command set compatible, with extensions for their own capabilities.

Rumours say that TDI's Modula-2 version 2.0 is on the way to replace version
1.4 and 1.10. However I still haven't seen it yet. Has anybody in netland
seen it, or even better used it already? If not, does anybody how long it
will take until version 2.0 shows up?

Frans Dorrestein.

Is there a 'SCSI' document on line any where ?
Can someone tell me where I can get a copy of a SCSI tech. document ?

TIA

Keywords: LISTEN UP ATARI!!!

I have been searching for a good word processor for my 520ST ever
since I got it. I have spent good money on a lot of poor word
processors that made big promises on the package and couldn't
back that up once the disk was slipped in the drive. 1st_Word
is missing a lot (only one font). Regency promised that would be
different, but didn't explain until I ripped the package open that
I must have a certain type of printer to get different fonts and
the stupid program works like a unix editor.

Listen folks, my request is simple. I want a word processor for
my ST that works like MacWrite. I want to see, on the screen, what
my text file looks like. And I want to be able to change sizes and
fonts independantly of other hardware. If it's already out there,
I haven't found it and would be afraid to put my dollars on the line
without a review. If it's not out there, why not? You software
guys are hurting this machine by selling it short with crappy
programs. I NEED this capability. Must I trade my ST for a Mac?

==========

I have seen the prototype of the SCSI interface and it does in fact
work. The status as of June 30 was that the developer (Beckemeyer
Development Tools) received a shipment of PC boards from a supplier
that were FUBAR. They are waiting for a re-do (might have it by now).
Boards will be available for just under $100 and include a real time
clock that will set the system clock in the ST on boot. Contact
Beckemeyer for more information.

I have no affiliation with Beckemeyer Development Tools other than as
a user of Micro C-Shell and I *like* it.

Hi,
I was wondering if anyone out there could send me microemacs.
The version I got from the net a few months ago is chopped.

Thanks,

Phil Paone

There is a public domain version of EDT available for the ST. It is on the
Atari BBS and on CompuServe.

Summary: ST (GEMDOS) disk structure

The ST (i.e., GEMDOS) uses the MS-DOS (3.X) disk and directory structure with
a couple of "minor" quirks: (these are the ones I know about; there may
be others).

a. The media type is only put into the BPB. It is not put into the
   FAT. Thus an MS-DOS disk driver that only looks at the FAT to get
   the media type will not be able to read an ST disk. In the other
   direction, the ST will only be able to read the disk if the BPB
   was fully built (i.e., MS-DOS 2.X and greater).

b. The ARCHIVE bit in the file attributes seems to have exactly the
   opposite meaning for the ST as for MS-DOS.

Summary: Info about SCSI on the ST

All of Supra's hard disks for the ST are SCSI drives; there's a small board
in the drive box that converts the DMA port lines into the host part of
a SCSI interface.

According to their price list the SCSI board is available seperately.
Supra is in Albany, Oregon (USA).

Summary: Getting address of RCS text fields...

One way to get the address of text fields in a loaded resource is
as follows:

Assume that "BOX" is the name you gave to the dialog box that
contains the editable field. Assume further that "FIELD" is the
name of the editable field. Then with the following code fragment:

```
#include ".h file created by resource construction program"
OBJECT *obj;
TEDINFO *ted;

    rsrc_gaddr(R_TREE,BOX,&obj);
    ted = (TEDINFO *)obj[FIELD].ob_spec;
```

the expression "ted->te_ptext" gives you the address of
the te_ptext field, etc.

```

I have a question:

I have a 1040 ST and I use the Megamax C compiler. What I want to do is
load in a DEGAS picture into memory and then copy parts of it into BITBLK
images that can be drawn using the objc_draw() routine. I think that it
is reading in okay, but I can't be sure because it isn't putting anything
on the screen in ANY of the resolutions. What I do is read the DEGAS file
into a 32000 byte character array (allocated with malloc()) and then
use type casting to read the bytes into the integer array. I declared
each of my images as an OBJECT (not OBJECT *). Could this be the problem?
I create the BITBLK record with malloc(). Nothing is drawn. Any help
would be greatly appreciated!   Thanks in advance,

I only recently purchased an Atari 1040ST, and would appreciate any pointers
which anyone could give me to archives of Public Domain Software for the ST.
(Especially any which I could access via FTP.)  I have also seen many posts on
net.micro.atari16 which refer to other posts which I have not seen.  If there
are any 1040ST related mailing lists to which I could subscribe, please sign
me up.

Thanks very much in advance.

There was a mistake in tut.prf that i posted about 10 days ago
with ProGem Parts 13-14. It was missing the line ".so wind9.prf".
Attached is the corrected version. Thanks to all that pointed the
error out. Apologies for the oversight on my part.

Please, I think it would be to the advantage of the net to give any
and all details -- I *don't* consider this commercialization. There
is a fine line between an add and information -- this network has
been set up for informational purposes, is it not?

Perhaps I've got it all wrong. Maybe the reason this is done is that
people like to get email?

Did anyone else receive a large quantity of messages from ARPA that
look like they have come from BITNET and from cernvax somewhere along
the line?

The result was quite a flush of "(none)" articles here. Must have cost
someone a pretty penny. Does someone document all this? Surely it is
done. I mean, the DoD is keeping track, right?

Summary: Avatex problems

I have been using an Avatex 1200 modem for about 6 months now, and have
only a few complaints. First thing, when I use it as a dial in for my
Altos system, it will go into some sort of sick mode after waiting for
a call for too long (too long being around 30 minutes). At this point,

the HS and RD lights will stay on until I turn it off and back on. I have
also noticed that if you use it for too long (greater than 6 to 8 hours),
it tends to mix garbage with the data. Also, it should have a detachable
phone cord and a much sturdier power cord receptacle. I couldn't tell you
if the first 2 problems are for just my modem, or if they apply to all
Avatex modems. Another thing, I can't figure out how to tell the modem to
stop saying CONNECT or CONNECT 1200 when someone dials in. This makes
my Altos think that someone is try to login on user CONNECT... Anyone
out there know how to shut off its messages (all of them)?

>manufacturer, unless of course you set the modems to use the industry standard
>speeds of 2400, 1200, or 300. These modems, if I remember right, are Hayes
>command set compatible, with extensions for their own capabilities.

The modem in question is the Telebit Trailblazer, marketed under an OEM
agreement by Digital Communications Assoc. (makers of IRMA PC-3270 card)
as the 'DCA Fastlink'. The only difference is the faceplate. The modem
uses an on-board 68K plus the TI signal processing chip plus lotsa RAM.
It breaks up the bandwidth of the phone line into something like 512
subchannels, then moves data through them at roughly 18kbps. On the
receiving end, the subchannels are recombined, CRC checks are performed,
and the data stream is presented at 9600 baud. The major advantage of
this modem over the CCITT V.32 modems now reaching the market is that
under less-than-ideal line conditions (i.e. most of the time), the CPU
will drop only those subchannels showing poor signal-to-noise, allowing
falloff in increments of < 100 bps. The V.32 modems fall back by halving
(9600 to 4800 to ...). It emulates 103, 212 and V.22bis (300, 1200 and
2400 respectively) modems and uses the Hayes command set. Friends have
used them and love them for bulk data transfer. In a 'worst-case' test
they did, they 'looped back' between two Fastlinks in their office via
MCI, SPRINT, and ATT and still got > 7Kb throughput.

Keywords: Lattice C, HACK

I ran across a problem in the Lattice C library, version 3.03.02 (I
believe that is correct) where file handles are not released to GEMDOS

when the file is closed. The manifestation is I created files with
     fopen(name,"wb") and closed them with fclose()
but the first write to the 21st file resulted in 2 bombs and a crash. I
have verified this with a small program that did nothing more than fopen(),
write a line, fclose() 26 times and it died on 21. This problem does NOT
exist in the version 3.03.04 library (it has problems with fprintf() to
stderr, instead).

What this means is that those of you playing the version of PC HACK that
I compiled with the 3.03.02 libraries might see bombs around the time
you reach the 20th or 21st level. I haven't gotten that far to verify
the problem exists. You might also see them if you save a game after
the 10th level.

"

The BIOS listing in the developer's kit has a section (sasi.s?) where
the ST tries to do a boot off the DMA port. I'll bet the Atari -->
SCSI board just doesn't respond to the boot sequence properly. (I don't
have the developer's kit here...).

Hmm.. well the Monochrome ST has 640 pixels across the screen.
640/132=4.84 (recurring) - this is a bit little to see. In fact, I
think that the 6*6 character set in the ST (106 characters) is too
small to do any real work with.

I used the 8*8 character set for a bit and found this tiring - this was
not because of the smallness of the characters but that the aspect
ratio was wrong, I think. The letters in words were too far apart.

I have found that the best small set is one derived from the 8*8 set -
a 7*8 set is possible to work with but only gives 91 screen
characters. I add two extra lines between the characters giving me a
40 line, 91 character wide terminal.

My conclusion therefore is that 132 character wide terminals are not
really possible on the ST for humans not equipped with binoculars.

The looping message problem has been eliminated.

A new subscriber was added to the list on Thursday, July 3. His mailer
and the SCORE mailer decided to ping-pong a message. The problem was
discovered by the Postmaster at SCORE on Sunday July 6 and the new
address deleted from the distribution list. The individual and the
Postmaster at his site were notified.

We all regret the inconvenience.

Summary: The ST and multiple fonts

The reason that the ST hasn't in general supported multiple fonts (except for some "special" programs that have been floating around) is that the portion of GEM for the 68000 (GDOS) hasn't had a production release yet. One company, MiGraph, is shipping a preliminary version with their EZ-Draw package, but most companies are waiting for the final version.

A final release of GDOS is supposed to happen "any day now" according to what I've seen in messages on the Compuserve Atari Developers sig. Products using it would come

out
a few months afterwards. I know of at least three wysiwyg text processors that
are
scheduled to come out in the third quarter of this year, in anticipation of the
GDOS release.

=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=- Line Easter -=-=-=-=-=-=-=-=-=-=-=-=-=-

Well, I took the advise of many and bought a 520ST from 47th Street
Photo for $500. I sure am glad I did -- I love the new system. However,
as hard as it is for me to believe (I was using a 800xl), I have found
that 512k is not enough memory for my needs.

There has been information posted all over about upgrading your ST to 1
meg, but, alas, I am no engineer, or even a decent solderer. Where can
I send my ST for an upgrade that:

A) Is relatively inexpensive and reliable
B) Has a quick turn around
C) Will _not_ void my Atari warranty.

As an aside, it would be neat if one could have an upgrade that simply
plugged into the cartridge port, so that clods like me could do it ourselves.
I think that it might be real seller, provided that it was possible.

BTW, why doesn't the line: 10 C$=INKEY$: IF C$="" THEN 10
in ST Basic allow you to enter a single key? It stays in the loop indef-
initly, and stores that characters you type until after you BREAK out.

Two places which I know of that do upgrades are

Nite Lite Systems Billerica, MA	(617) 663-4463 BBS: 663-4221 should get the job done in a few days (but ask him)	Paul Swanson, prop. is VERY competent and
CompuClub Framingham, MA	(617) 879-5232 (800) MY-ATARI the upgrade (approx)	Seem like nice peopl and charge around $140 for

By the way, are you interested in selling your 800XL?

What are all these (wasteful!) messages from ACS19....CERNVAX...BITNET stuff
and why are the coming. I just got through cleaning out about 300K worth
of them from this and a few other newsgroups. Seems like lots of BITNET
headers were contained in these files.

Whoever is responsible for sending these things, please stop.
(or at least investigate what is going on!)

  Has anyone figured out how to use the Xbtimer() extended BIOS function ?
I would sure appreciate a kind soul telling me how to set up a timer, turn it
on and turn it off.

  I don't want to use the 200Hz system clock, I do want to use the A timer of
the 68901 via Xbtimer().

Thanks,
Glenn C. Scott

ProGem hits once again. I gather from the posting that parts 13 and 14
of the text were posted recently. Does ANYBODY actually seen it? Could
somebody mail me the missing posting? Does anybody has some clues why a
traffic in this group behaves in a such frustrating way?

I'd like to have some information on a battery backup for the internal clock in the 520 ST. I know someone posted a scheme for doing this many months back; has anyone tried anything of the sort? With success? I would appreciate hearing about any experiences anyone may have had concerning this. Please reply directly to me at the address given below, I'll summarise to the net if I get something. Thanks,

I recently transfered a binary of Hack writtin for the Atari 520ST from
my host to my Atari. Unfortunately, I do not have access to Compress/
Uncompress.

Has anybody ported it to the 520? I have the source in "c" for an IBM
version, but the programming is over my head. I'm still trying to learn
the language.

If my address is not sufficient from your host, try:

        ETCS(SW) Lynn B. Dobbs
        Code 33
        Naval Ocean Systems Center
        San Diego, CA 92152-5000
        USA

Thanks.

Could anybody tell me how or where to get this in the netherlands ?
It is a bit expensive to do that by phone from the U.S., and i don't even

know the number to dial.
Another possebility is : Can sombody send it to me or the net ?

Very many thanks in advance from me and probably other VAX/VMS and ATARI users.

Thanks to Rodney Black the game HACK has been added to the STarter Kit
(only the executable and help files which amount to an entire disk).

Also, thanks to Mitch Bradley, the latest version of FORTHMACS has replaced
the older version in the STarter Kit. FORTHMACS is interesting because it
is much more than FORTH - it is a development environment and many tools have
been provided in FORTHMACS (which is why it requires an entire disk).

If you want the STarter Kit utilities only, send three floppies formatted
single sided, SASE and packing material to the address below. If you want
FORTHMACS add another disk. If you want HACK add another disk.

>Anyway, these lowpass operations amount to smearing of detail in the picture
>or intentionally limiting resolution. Apparently the chroma suffers the
>worst, which is why in color TV pictures the red areas sometimes appear to be
>painted on sloppily so they spill outside the area that was supposed to be
>red.

One factor in this filter (for monchrome) is that the "filter" is actually
an analog filter, which means that it is rated in terms of db or mv / ns,
some people have been able to get higher resolution from monochrome simply
by using less signal contrast, and letting the tv provide the contrast
enhancement.

The problem with using a standard color TV is that the TV has "stripes" or
pixels that are dyed for each color. If you try to double the resolution,
this will cause two pixels of different colors to be fired at each dyed
pixel. The effect can be quite unusual :-). High resolution monitors
running in low resolution mode simply cycle the same three color "bits"
twice.

>If you could get the baseband luminance signal out of the Atari before it has
>been filtered, you might get the resolution you desire. I have no data on the

>circuit, but maybe somebody out there knows if this signal is available to be
>brought out. I speculate that it may be available somewhere over on the
>monochrome monitor output. If it is still active somewhere even when you have
>plugged into the other jack, you may be able to get access to it.

>Too bad they didn't provide an option of 60-Hz standard monochrome output as
>well as composite.

The problem here is that the television actually runs 30Hz with interlace to
get 60 Hz signals. On the ST, the mono mode is normally 70 Hz non-interlaced.
This means you have to have 2.x times the bandwidth of a normal tv. It would
be possible to get a relatively flicker free signal using 70 Hz interlaced
into a normal black and white TV.

>The other trick that comes to mind is to run your monochrome monitor off the
>GREEN output of the RGB output. That is supposed to give a reasonable
>monochrome picture for most normal scenes.

The question here is, does the green output provide sufficient blanking
and retrace levels to keep the mono in sync?

I would suggest that you take a look at "The Cheap Video Cookbook" and
"The Son of Cheap Video". In addition to some of the ideas mentioned
above, they have a nice "recipe" for an RGB to composite monchrome
adapter using mostly descrete logic and one or two transistors.

You also may want to look at the spec sheets for the MC137X motorola
line for an RGB to TV converter.

Can somebody please mail me 'uw' for the Atari ST 520 ?

We have no esoteric decompression tools, so the binary > ascii translation
must be kept simple. On the Atari side we only have kermit to download it,
no special binhex tools or what have you.

I only need the (40-50KB) program that runs on the atari. Our 4.2 Unix system
already has the uw host-part up & running. (We run uw on the Macintosh but
want to know how the Atari-uw compares).

Thanks in advance for any response,

[]

Can any kind soul out there tell me how to get a complete set of manuals
for the 1040ST before I buy one? The people who work at the Atari stores
in my area are not very helpful, in fact they barely can make Neochrome
work. Asking them technical questions is as useful as pushing a rope. :)

Any help would be greatly appreciated. I figure a set of manuals are a lot
cheaper than buying the machine only to find out I can't deal with it...

Thanks in advance.

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject:      millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job.  Is there someway to do our own math to get
millisecond timing?  Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject:      millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job.  Is there someway to do our own math to get
millisecond timing?  Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't seem to be doing the right job. Is there someway to do our own math to get millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject:	millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get

millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

I have yet to find a really good editor for the ST. What I would really like
is something like VEDIT - simple, quick, and powerful. Any suggestions?

              mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject:      millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job.  Is there someway to do our own math to get
millisecond timing?  Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

I'm writing a book about portable C software, and I'd like to make it
as accurate and complete as possible. While I'm reasonably familiar
with several versions of UNIX, and with somewhat familiar with MS DOS,
I haven't made much use of some other important operating systems where
C is heavily used, including the Macintosh, Amiga, Atari ST, VMS, IBM
MVS, and so on.

I'd like to hear from users of these other systems who are very familiar
with their C implementations. I'd like to know which compiler and C
library are most widely used on that system, where I can get a copy of
the manual, and any comments about portability to that particular system.
If you might be interested in reviewing a copy of the book to check for
correctness (when it's ready) I'd also be most appreciative.

Thanks in advance,

     Mark Horton

Subject: millisecond timer

Does anyone have some source for using the xbtimer function of the MFP.
We are trying to get the time in milliseconds, and the event_timer call doesn't
seem to be doing the right job. Is there someway to do our own math to get
millisecond timing? Say polling the clock?

mike

>   if I give it `INIT B:'

thats write, despite what the documentation says, i only works properly
if you have a double disk system (like me) - and then you can init
both single or double sisded disks ok.

>c) I have a few ramdisks, but none seem to be `INIT'able with eg.
>   `INIT D:'

I had this problem too, using real disks the disk must be freshly formated
not just empty (ie all files deleted) otherwise init says 'not empty disk'.
It presumably does a check to see what is on the disk somewhere. In that
case, it should be possible to modify the source code of a ram disk to set
it self up as needed.

It would have been nice if the emulator set up all free mem as a ram disk
anyway - as it wont be needed for anything else.

By the way, if you got the bits from mikes, does that mean you live in
the southend area (i do).
My home address is 51 Chapel Lane, Benfleet, Essex, SS7 2PW
                   Tel 0702 557468
I am at Reading Univ doing a CS degree

If you do live near, perhaps you might like to drop in some time (after july
the 3rd when term ends) and we could swap PD software etc.

Ive got a rather good screen saver which i will try to send in some time.
Once the program is run it is hooked into the screendump VBL interupt.
If you type alt help the full pallette and screen data are saved to disk
in degas format. I have converters to go degas>neo neo>degas.

(unfortunately my st isnt connected to the net, so it may be a while before
i can do so)

Thsi works with allmost all games (not bratacus as it replaces the os)
(only monochrome pawn as in colour a split mode is used so they take over
the interupts.)

It apears to have no side affects - i used this to give my local dealer a
good slide demo, and when one of the assistants saw the megaroids screen he
 decided
to play it - and couldnt work out why it didnt work

ps. Im also writing a backup program that can duplicate ANY floppy disk
on the ST. Ill tell you all when its finished.

28	HARLEY.NQO	10843	A motorcycle, digitized and hand colored
29	HEMAN1.NQO	12966	Digitized from the cartoon by ComputerEyes
30	HEMAN2.NQO	12686	More cartoons from ComputerEyes
31	JOHNNY.NQO	11635	A digitized photo of a boy
32	OUIJA1.NQO	8598	Imagine this one with full mouse control...
33	SANTA.NQO	13512	Santa from ComputerEyes
34	TURNIP.NQO	16054	Cheech Wizard in a typical monent.
35	PIX.PQC	288000	Also get PICSX.PRG. Best with hard disk. LONG!!
36	PICSX.PRG	8315	Driver program for fast picture demo.
37	DEMOPICS.DAT	1884	Polarware demo program -- also get CCDEMO.PRG
38	CCDEMO.PRG	8221	Polarware driver. Nice use of "metafile" pictures
39	BEE.PQ1	19199	A bee, works with DEGAS and SHOPIC.PRG
40	DIRE.PQ1	11038	Scene from the Dire Straights song.
41	SGHOST.PQ1	15680	Space Ghost from Saturday morning. DEGAS format.
42	SUPMAN.PQ1	13729	It's a bird! It's a plane! It's for DEGAS.
43	TROUBLE.PQ1	12106	Looks like big trouble, too. DEGAS format.
44	COMET.PQ2	17160	Our favorite celestial visitor (no, not E.T.!)
45	FONTS.PQ2	15608	DEGAS type fonts sample.
46	SHOPIC.PRG	3898	Slide show for DEGAS format pics (PI1 and PI2)
47	STSQ.TTP	17152	This is a squeeze utility for Degas format pics.
48	STUSQ.TTP	15104	Degas pic unsqueeze utility
49	NINJA.PQ3	7424	My favorite motor vehicle / sudden
50	BROOKE.PQ3	12032	Digitized Brooke Shields / hi-res
51	CHRISTI.PQ3	15616	Digitized Christie Brinkley / hi-res
52	MORGAN.PQ3	16128	Digitized Morgan Fairchild / hi-res
53	PERSIAN.PQ3	19712	Hi-res cat
54	BEAGLE.PQ3	21504	Hi-res beagle
55	CCASTLES.NQO	13568	The first screen from Crystal Castles
56	CLOWN.NQO	13951	The funny guy
57	BTTODEGA.PRG	7206	8BIT CUSTOM FONT TO DEGAS FONT CONVERTER
58	CADOUTP.PQ3	19969	SQUEEZED OUTPUT FROM TOM HUDSONS CAD PROGRAM
59	BALL.PQ3	9216	DEGAS HIRES BALL,SQUEEZED, UNSQUEEZE W' STUSQ.PRG
60	SNAPSHOT.ACX	0	Screen snapshot in Degas mode, rename SNAPSHOT.ACC
61	VLSI.PQ3	22016	Hi res squeezed picture from jail
62	JAIL.PQ3	16384	Hi res squeezed picture from jail
63	NIGHT.PQ1	11904	Low res, squeezed picture of beach at night
64	WHOBOX5.NQO	7900	For Doctor Who fans
65	STARSHIP.PQ3	12544	PIC from Tom Hudson's 3D CAD program, squeezed
66	TRAMIEL.NQO	26700	Jack Tramiel. Digitalized picture from Hannover.
67	HARTMANN.NQO	26347	Sig Hartmann. Digitalized picture from Hannover.
68	GARFIELD.PQ2	5376	Translated from MacPaint - Garfield cartoon clip
69	FISH.PQ1	18688	Translated from Amiga Deluxe Paint
70	RANXPIC.PQ2	25718	DEGAS PIC
71	MODERN4.PQ3	21974	HIRES DEGAS PIC OF LARGE SCALE INTEGRATED CIRCUIT
72	APLATE.NQO	10300	NEO PIC
73	EQUIP2.NQO	11868	FANCY EQUIPMENT

74	HIGHTECH.NQO	9160	HIGHTECHNOLOGY IN ART
75	OUIJA1.NQO	8598	CREEPY BOARD
76	TROUBLE.NQO	12106	Big Trouble
77	TURNIP.NQO	16054	VEGETABLE?
78	XMAS.NQO	15783	THE HOLIDAY
79	BALL.PQ3	9216	HIRES 3D BALL
80	GERWALK.PQ3	10240	SCENE FROM JAPANESE ANIMATION
81	NUKETEST.PQ3	14464	SCENE FROM NEAR GROUND ZERO
82	WEB.PQ3	17536	ABSTRACT ART
83	ZGUNDAM.PQ3	5376	ANOTHER SCENE FROM AN ANIMATION
84	POETRULE.TXT	5888	Rules for the contest
85	COTTAGE.NQO	27264	squeezed neo pic of a nice cottage
86	ENTERPRI.NQO	7424	squeezed pic of the USS ENTERPRISE
87	GORILLA.NQO	25856	squeezed Neo pic of the large anthropoid
88	HORSES.NQO	20224	the equine variety, squeezed NEO pic.
89	JWOMAN.SQ2	22920	from Npaint program
90	SPACESHI.NQO	12672	spaceship w alien pilot, squeezed Neo pic
91	WALL.PQ1	18560	squeezed pic of someone's wall
92	HITCHIKR.PQ1	5632	a face familiar to hitchhiker fans
93	CONVERT.NQO	5632	Porsche convertible
94	ODIE.NQO	8832	squeezed NEO pic of THAT dog.
95	GIRL1.NQO	20096	squeezed NEO pic of a human female
96	GIRL2.PQO	11264	another similar squeezed NEO pic
97	PLANETS.NQO	7936	A squeezed pic of a water rich sphere.
98	PORCHE.NQO	7296	'nother Porsche, squeezed NEO format
99	BUGS.PQ1	14464	Bugs Bunny
100	SONY.NQO	12369	Ad for the TV
101	BLUEBANG.NQO	6488	basketball court
102	SKINDIP.NQO	10182	swimming fun
103	HERRON.PQ3	9216	NO.1 on the FBI Most Wanted List
104	MALVERT.PQ3	8320	No.2 on the FBI Most Wanted List
105	EAGLE.PQ3	6400	a patriotic bird
106	FORT.PQ3	22528	a strong point
107	DUKE.PQ3	8320	the Duke, from Hollywood Hotline on CIS
108	MARILYN.PQ3	7296	that famous blonde
109	BOGIE.PQ3	6784	That famous guy
110	BISSET.PQ3	5760	Jacqueline, nice, from HHL on CIS
111	CLAUDIA.PQ3	6784	Claudia Cardinale form HHotline on CIS
112	*** Purged ***		
113	TINYVIEW.DOC	6016	Doc for tinystuff series,squezrs, convertrs, viewr
114	TINYSTUF.PRG	7168	squeezes, unsqueezes and converts, Neo, Degas.
115	TINYVIEW.PRG	1536	views squeezed tiny files.
116	CCASTLES.NQO	13568	fancy castle from crystal castles
117	*** Purged ***		

system 4 408-745-4758
sig 8 [*] ST Computers

Number	Filename	Bytes	Description
1	CHESS.PRG	39282	A 3-D chess board demo from England

2	GEM1STW.HEX	9728	1ST_Word printer source file for Gemini printers
3	TOSHIBA.HEX	7936	1ST_WORD PRINTER SOURCE FILE FOR TOSHIBA 24 PIN
4	HI50.PRG	161	Converts VT52 to 50 line screen (mono only)
5	HI50.S	909	Source code for HI50.PRG, in assembly language
6	HI25.PRG	161	Re-sets VT52 to 25 lines (see HI50.PRG)
7	HI25.S	928	Assembler source code for HI25.PRG
8	DOODLE.PRG	20852	A public domain paint program. Also get DOODLE.RSC
9	DOODLE.RSC	3351	Resource file for DOODLE.PRG
10	HEX.PRG	6528	Draws hexagons to demonstrate >16 colors at once
11	BOINK.PRG	11493	The famous ST bouncing ball, with sound
12	CLOCKA.ACC	7552	Analog clock by Jim Tittsler of Atari. Desk acc.
13	DIGICLOK.ACC	5632	Another clock accessory, this one is digital.
14	PUZZLE.ACC	5376	A sliding puzzle desk accessory.
15	TITLE.BAS	896	Shows how to change the window name in ST BASIC.
16	SEIVE1.LOG	779	A prime number sieve in ST Logo.
17	SEIVE2.LOG	717	Another Logo prime number seive.
18	CALC.PRG	17536	A pushbutton calculator
19	XLISP.TTP	60800	UPDATED pub. domain LISP from Byte, see XLISP.DOC.
20	DESKTIPS.TXT	19456	John DeMar of QMI gives hints on using the ST.
21	GEMINDEX.TXT	12544	DRI's index to GEM calls in the developer docs.
22	STSOFT.UPL	14010	Latest list of ST software, current as of 1 Dec 85
23	ASM68K.TTP	35072	Public domain assembler. See ASM68K.DOC
24	ASM68K.DOC	3456	Documentation for ASM68K.TTP
25	MIDIDEMO.PRG	666	Play .SNG files. Get 4TH.IMG, 4TH.BLK, & a synth.
26	4TH.IMG	12888	File needed for MIDIDEMO.PRG
27	4TH.BLK	30720	File needed for MIDIDEMO.PRG
28	BANJO.SNG	2722	Song for use with MIDIDEMO.PRG
29	CLEM.SNG	5979	Oh my darlin' Clementine. Use with MIDIDEMO.PRG.
30	EVITA.SNG	11970	Broadway song for use with MIDIDEMO.PRG
31	MINUET.SNG	1635	Old fashioned music hi-tech. For MIDIDEMO.PRG
32	MOSCOW.SNG	2098	JT's favorite song, for MIDIDEMO.PRG
33	MUSETTE.SNG	1371	Another MIDIDEMO.PRG song.
34	SANJOSE.SNG	9450	Do you know the way? Use MIDIDEMO.PRG.
35	SANFRAN.SNG	12451	Open your Golden Gate, use with MIDIDEMO.PRG
36	STWRITER.PRG	32657	ST Writer word processor, (C) 1985 Atari Corp.
37	STWREF.DOC	45824	Reference manual for ST Writer. (C) 1985 Atari
38	STWTUT.DOC	44688	Tutorial for ST Writer. (C) 1985 Atari Corp.
39	README.DOC	1588	More instructions for ST Writer.
40	QUIKREF	4232	ST Writer quick reference guide.
41	TEMPLATE.STW	1269	Text file to create a keyboard ST Writer template.
42	STCONFIG.TOS	14585	Printer driver configuration program for ST Writer
43	XYZZX.TXT	836	Edit this file for your printer & use STCONFIG.TOS
44	XYZZXOKI.TXT	850	Config file for Okidate Microline 193
45	FORTH.TOS	67246	Public domain Forth 83 from San Leandro Comp. Club
46	KERNEL.TOS	25571	Forth kernal from SLCC
47	DVORAK.TOS	1408	SETS ST KEYBOARD TO DVORAK PATTERN

I have a request: does anyone know of a print utility for the Atari that
will allow the user to capture screen output and send it to the printer?
Or, alternatively, does anyone know of a "script" utility for capturing
screen output and storing it in a disk file?

May as well post all responses in case anyone else is interested....

    Sounds like you are not in Super Mode before trying the operations.
See Supexec (xbios(38)) or Super (gemdos(20)). Hope that helps.

Announcing major news for Atari ST. users:
---------- ----- ---- --- ----- --- ------

COMPUTE!'s Atari ST disk and magazine - A bimonthly magazine devoted exclusively to Atari ST enthusiasts that includes a disk containing all of the programs found in each issue.

Atari has proven the pessimists wrong. The Atari 520ST and 1040ST have become the bestsellers among the new generation of personal computers. Both are breakthroughs in price and performance, and the community of ST owners is growing by thousands each month.

That's one reason why COMPUTE! Publications is announcing a new magazine specially designed for ST users. At the same time, we recognize that the power of the ST presents a unique challenge to magazines which publish program listings. That's why we're including a 3 1/2-inch disk that contains every program found in each issue -- ready to load and run. No more typing!

Here's what you'll get in every issue of COMPUTE!'s Atari ST Disk & Magazine:

o Top-quality programs. Utilities, Games, Educational programs for youngsters. Application programs for home and business. And since all the programs will be on disk, there are few limitations on length or languages. A typical disk might contain an elaborate adventure game written in BASIC, a programming utility written in machine language, a dazzling graphics demo in compiled Pascal, and a useful home or business application written in Forth or C.

o Neochrome of the Month. Take a look at what computer artists are doing with the Atari ST. Each issue's disk contains a NEOchrome picture file ready for you to load and admire. Are you an artist yourself? Send us a picture of your own, and we'll pay you if it's published.

o Regular columns. If you're a programmer -- or would like to be -- you'll love our columns on ST programming techniques and the C language. Or check out our column on the latest events and happenings throughout the ST community. Or send your questions

and helpful hints to our Reader's Feedback column.

o Reviews. Honest evaluations of the latest software and hardware for the Atari ST.

o News & Products. A comprehensive listing of the newest releases for your ST.

o And more: Interviews with ST newsmakers, reports on the latest industry trade shows, and overviews of significant new product introductions.

Starting with the October issue (available September 1), COMPUTE!'s Atari ST Disk & Magazine will be found on newsstands nationwide for only $12.95 per copy, including disk. Or it can be delivered directly to your mailbox six time a year for only $59.95 -- a savings of over 20 percent.

COMPUTE!'s Atari ST Disk & Magazine
ABC Consumer Magazines, Inc.

For some reason, we have NEVER gotten any postings from atari at our
site, and this makes it rather difficult to follow neil harris'
postings. Obviously.

So where's it all going?

I do not know which FONTLOADER you are talking about but the one done
by Patrick Bass (I think that is the name) only works with TOS in RAM.
You need to create a boot disk containing a boot sector and TOS.IMG then
boot your system from that disk.

are ready to link. Create a file called hack.lnk containing the linker
directives. It should be modelled after c.lnk, but expand the body to
include all the .bin files you compiled above (instead of taking the
command line). Here the strategy is to copy the first disk of .bin
files (the one that is full) to the RAM disk and place the second disk
on the drive, writting the .ttp file to the drive; thus, each .bin file
on the second disk should be referenced in the .lnk file as b:name.bin.
Resize the RAM disk to 435K (this is the smallest I could make it and still
fit everything on it, leaving the rest of the RAM for the linker). Copy
to the RAM disk the following:
     * the linker (link.ttp)
     * the libraries (clib.bin and startup.lib)
     * the all the .bin files from the first disk
     * the hack.lnk file
Run the linker with the following command line (leave off link if
invoked from the desktop):
     link -with hack -nolist -prog b:hack.ttp
After 15 minutes (if all has gone well), you should have an executable
file on drive b.
[...]
/* ---------- */

I found out that if you arrange the program output to go to the ram disk
and keep all other files except the library on normal disk, you can link
hack within 6 minutes.

(Flames to /dev/null)

Could someone give me pointers to free Atari ST software available via
FTP? I'm choosing between the 1040ST and Amiga, and what could clinch
it for the ST is availability and accessibility of free software
(cheapskate, me? of course!). The main thrust of my search is
towards word processors, terminal programs, Unix shell emulators,
languages, and of course sound/graphics programs that can take the ST
to the limit. Also, any possible multitasking utilities.

Thanx in advance for any replies.

                      David

Summary: No it is not possible/practical to upgrade the ST (as it sits) to a
010/020.

In article <8606201839.AA06129@pavepaws>, dillon@PAVEPAWS.BERKELEY.EDU (Matt
Dillon) writes:
>
>   Anybody know if it's possible to upgrade the ST's 68000 to a
> 68010 or 68020?
>
>   -Matt

As far as I've been able to determine the ST does no checking on boot for
the type of 68000 installed. Therefore the exception handling routines in
TOS will bomb (ie. lockup) miserably. Further (and I've mentioned this
before) some dimwit went and put the exception numbers in the upper byte of
the exception vectors!!!! Odviously this will give you an 'E' ticket into
the Twilight Zone on the 020!

Much of the system software in the ST is really JUNK. In Atari's defense
however, they never claimed upwards compatibility among future machine
archetectures (SP?).   Still I'd pay another $50-$75 to get a new version of
TOS in ROM (2.0 ?). No, this is not rumored. I just want Atari to know if
they ever WERE to decided to re-write some of TOS/GEMDOS themselves (and
get it right) instead of DRI's junk, *I'd* be willing to pay for it.

Neil? Others???? Comments???

        A local Atari dealer reported that ROM upgrades for the original
520STs are in short supply. Dealers were shipped just enough ROMs to
update the machines they had sold. Unforunately, there seems to be a
missed communication between Atari and at least some of the dealers. I
bought the ROMs from a different dealer, leaving the poor guy at least
one short.
        Appearently, *extra* ROM sets will be available, I assume as reapir
parts, but at a much higher price. (Only as it should be, I guess)
        It now appears necessary for a redistribution of the available
resources. How about it Neil @ Atari? Will Atari poll its dealers for
an inventory of ROM sets, and request (or direct) redistribution?

If you have a 520 with RF modulator output, you should be able to add a
composite output fairly easily, as the baseband input to the RF modulator is
precisely the composite signal. All you have to do is bring it out, possibly
with an amplifier stage if the level is not right. More likely just a switch
or a parallel tap off the input to the modulator will work fine.

I haven't seen the schematic, but you may also pick up some resolution on the
composite output by removing a "slowdown" capacitor put in to keep the TV
modulator bandwidth down. Or, you might be able to leave such a capacitor in
place and pick off your signal before the slowdown circuit has affected it.

Good luck.

*****[Ignore header path]*****

I got several requests for ordering information for STart magazine.
I was going to send this information privately since I don't want
to be accused of commercializing the net but since I was asked to
provide this information publicly, I will do so.

STart magazine is published quarterly by Antic Publishing. It is
or should be shortly available at better book stores, magazine stands and
computer stores that carry Atari ST computers for $4 for the magazine or
$14.95 for the magazine and the disk of programs together. I'm
sure that combination will be hard to find an magazine stands/book stores.
You can only subscribe to STart in combination with ANTIC magazine. You get 4
issues of STart with the program disks and 12 issues of ANTIC for $59.95. You
can't get just STart and the program disks by subscription but since
you are basicly getting ANTIC free, it's a pretty good deal. Especially
when you consider ANTIC is still going to carry the ST Resource part
of the magazine. It contains a lot or reviews and new product announcements,
etc. If you want to write, their address is:

STart
Antic Publishing
524 Second St.
San Francisco, CA 94107

If you want to charge it to your credit card, you can call their
toll free number 800-443-0100. Hope this answers all questions about
subscribing. End of commercial...

[munch, munch ...]

I was hit by a rather obscure bug in TOS, Below is an exact description
of what happened. Does anybody else happen to stumble upon the same
problem?

SYSTEM
    Atari 1040 ST. TOS in ROM (of course). One DS drive.
    Only operating system and basic accesories loaded. No RAM-drive
    at the moment.
ACCESORIES (which you need to reproduce events)
    A disk which sometimes in a past was initialized as two-sided.
    Currently re-initialized as a single sided and completely filled
    with files.
SITUATION
    At the Desktop, by a mistake I tried to copy one more file to
    the disk. Without RAM-drive I used "copy a: to b: and swap, swap,
    swap..." method.
RESULTS
    Operating system happily went throgh motions. No error reported
    during the whole operation. First indication that something went
    amiss was that a directory listing looked exactly as before the
    operation. As it turned out some parts of a file which I tried
    to copy - a program file - were deposited on the disk overwriting
    an end of one file and a begin of the next one. Apparently some
    pointers in FAT for the second file were changed making the last
    sector of the second file its begin - at least in some circumstances.
HOW TO AVOID
    I don't know. Be careful and tip-toe around.

Here is a copy of a C.E.S. (Consumer Electronics Show) report from the
show in early June that I got from a local BBS in N.J. I don't know if
it's the same as what Antic normally reports or if it originated from

Compu-serve, but I guess it's better than nothing.

It contains information relevant to 8-bit and 16-bit Atari computers, so no flames please for cross-posting.

Owen Alexander @ houxl!oaa

>>THE CHICAGO CES REPORT<<

PART I

Atari's exhibit space at the Chicago Consumer Electronics show is the largest seen since the Tramiels took over the company. Walls of monitors displaying Atari software, ranging from ST computers to 2600 game machines, surrounded some 35 third-party developers showing off both 8-bit and ST software.

CES breezed into the Windy City Sunday, opening to brisk crowds. While Chicago natives soaked up the first of the season's hot, humid sunshine, electronics mavens crowded inside the huge McCormick Show Halls off Lake Michigan and ogled the techno-wonders.

As an added bit of Atari nostalgia, a central room contained such coin-operated Atari arcade games, as Asteroids, Dig Dug and Jungle King. Two special display areas were reserved for MIDI and digitizing software. In the MIDI booth, Hybrid Arts showed its many sophisticated products for ST and 8-bit. Activision demonstrated The Music Studio, also available on both ST and 8-bit. The digitizing booth displayed Computereyes for the 8-bit and HippoVision for the ST.

BATTERIES INCLUDED GOES PUBLIC

Michael Reichman, president of the successful Canadian software firm Batteries Included, announced a merger with ITM Corp. This means Batteries Included stock may be publicly traded on the Canadian Stock exchange.

Reichman also said that Russ Wetmore, author of HomePak, has accepted a position with Apple Computers in Cupertino, CA. Whatever he is doing is evidently very hush-hush as Russ said only that he was working in "advanced research production" and would say no more. Reichman awarded Wetmore a plaque for outstanding achievement in world-wide sales for his HomePak software. Ian Chadwick accepted the award in Wetmore's absence.

THIRD-PARTY DEVELOPERS

Judging from this show, the Atari software business seems very active--certainly more so than in recent shows. Several companies with Atari booths had their own booths elsewhere on the floor.

Artworx showed its bridge programs for both 8-bit and ST, and

Hole-in-One Golf for the ST. They also have a new 8-bit program called Peggammon.

Omnitrend -- Universe II for the ST.

Migraph -- EasyDraw.

Zobian Controls -- The Rat, a mouse for 8-bit Atari computers.

First Star Software -- The company that made Spy Vs. Spy and Boulder Dash for the 8-bits is coming out with Comic Strip Maker, a graphics program for the ST.

Activision -- Paintworks, which is their new name for the N-Vision graphic art program created by Audio Light, Inc.

Michtron -- A whole slew of products for the ST, including the Time Bandits game and the SideKick-type CornerMan utility.

Classic Image -- Disk Library and a game called Diablo.

Epyx -- Winter Games and Temple of Aphshai Trilogy on the ST.

MicroProse -- ST version of Silent Service.

Sierra On-Line -- Several animated adventure games. The most recent is Black Cauldron.

Softworks -- BASIC compiler for the ST.

Avila Associates -- Make it Move, an ST graphics animation program, and a gambling tutorial currently called Casino Craps.

Softsync -- Personal Accountant, an 8-bit financial program.

Blue Moon Software -- A collection of GEM Desk Accessories including MacroDesk, MacroMath and MacroManager.

Academy Software -- Typing Tutor and Word Invaders for both 8 and 16-bit Ataris

Spinnaker -- Displaying an extensive line of 8 and 16-bit educational and adventure game products.

American Educational -- A series of educational software for 8-bit Ataris.

OSS -- 8-bit and 16-bit programmer's tools.

ICD -- 8-bit hardware and software.

XLent -- Displayed the entire line of products, including many printer/graphics packages available for both 8- and 16-bit machines.

Haba Arrays -- Get Rich, a financial planning package for 8-bit machines.

FTL -- The creators of Sundog for the ST, are also showing Micro Cookbook and Dungeon Master Adventure.

Britannica Learning -- A series of educational programs for the 8-bit Ataris.

Batteries Included -- A new version of PaperClip for the 8-bit with Spellpack. Thunder, a real-time spelling checker.

Electronic Arts had two Atari booths. One to show off their long line of 8-bit game products and the other to display Financial Cookbook for the ST. According to an EA spokesperson, such EA hits as Golden Oldies will be adapted to the ST, and they are not currently planing to adapt Marble Madness to the 16-bit Atari computer.

Covox -- Voice Master, Atari 8-bit voice digitizer and voice recognition software.

SSI -- Booths for both lines of Atari computers and displayed many of its very successful strategic games.

Quickview -- Software author Paul Heckel showed his Zoomracks ST database program.

NEW ST MAGAZINE GETS A START

Antic Publishing unveiled its new ST quarterly, START, a combination magazine and disk. Instead of type-in listings, all program listings are on the disk, which is bound into the magazine in a tear-proof envelope.

START is targeted at the experienced ST computer owner. The first issue features a MIDI Sequencer, which records and stores synthesizer song files on disk.

Tom Hudson has written a desk accessory which will store any DEGAS printer driver in RAM, then capture the [ALTERNATE]-[HELP] key combination for a successful screen dump.

Tim Oren reveals the secrets of GDOS and Metafiles. A thorough comparison of available ST Assemblers is contributed by Chris Chabris. And David Small explains why he distrusts computers in "Voodoo Computing."

By the way, I am writing this upstairs, right outside the Commodore booths, the only place in the hall where it's quiet enough to talk or concentrate!!

PART II

Atari's John Skruch, Manager of XE Software Products, showed us the XEP 80 -- the long-awaited 80-column adapter for the Atari 800, XL/XE computers. The adapter is "new-Atari" gray-colored and just slightly smaller than the old Atari 850 interface. As Skruch said temptingly, "It has the same 'footprint' as the 8-bit 3.5-inch drives." Reliable sources within the company report that the drives will have a capacity of 325K, formatted, and the Disk Operating System will be compatible with DOS 2.5. The XEP 80 has a standard Centronics parallel printer port in the back, an RCA monitor input, an I/O cord that plugs into either joystick port and an input for its external power supply (which is about the same size as most modem power supplies). The card was demonstrated on a standard green monochrome monitor and the letters looked as crisp and clean as an IBM PC screen display. Atari claims the adapter will also work with a color monitor, but not satisfactorily with a television set. Built-in software supports the entire Atari internal character set, including special graphics characters, plus the Atari international set and an expanded international set contained in the ROM of the XEP 80's controller chip. The card supports any call which works with the E: device and has such special effects as black on white or white on black, double-width or double-height characters, and blinking or solid cursor and characters. Skruch said there was a special "burst" mode which printed text to the screen "four times faster" than normal. Although cartridges such as BASIC XE, from OSS, work with the new adapter, most software will have to be specially adapted for it. Also, programs that use bit graphics will have to try something else, since the usual bit graphics screen fills only half the 80-column screen. The XEP-80 is expected to reach dealers in late fall with a price tag just under $80.

ATARI PRINTERS

Ever since Atari displayed the first ST a year ago, it has been showing printers. Only now are the dot-matrix graphics peripherals being shipped, at a price of $219.95. The XMM 804 for the ST and XMM 801 XE printer are essentially the same. The 801 is compatible with the Epson medium-resolution graphics mode and contains a built-in interface for the 8-bit machines. The 804 supports up to 1,280 dots per inch and uses a standard centronics cable to link it with the ST. Though both machines were designed to be as compatible as possible with Epson printers, they are also fully compatible with the earlier Atari 825 printer and are designed primarily as a new, improved printer for those who previously owned the 825.

ICD SUPPORTS THE 8-BITS

While many companies have jumped on the ST bandwagon, ICD has been quietly churning out important hardware items for the 8-bits, including a straight- connect modem cable for $14.95, a low-cost printer connection for $59.95, and The P:R: Connection, a replacement for the Atari 850 modem interface. The P:R: Connection ($89.95) is a small box with one printer port and two modem ports. It gets its power from the computer and works on any Atari 8-bit machine.

RATS, AN 8-BIT MOUSE

Matthew Zobian, of Zobian Software, showed us his baby "the Rat", a mouse for the 8-bit Ataris. Zobian feels the mouse is the "wave of the future" in computers and, because the Atari 8-bit is such an excellent graphics machine, it seems perfect for mice-- or rats. The Rat comes with its own software, including a graphics program and a cursor control routine. But Zobian realizes he must court other software developers to make a success of his interface. Accordingly, he told us that MTS is developing mouse-compatible Big Picture and Artist Unleashed -- both graphics packages. RAMbrandt, another paint program, and a business management package by Reeves Software are also being adapted to The Rat. The single-button Rat is an analog mouse which plugs into the joystick. Zobian claims that it is very easy to program. Without accompanying software, the Rat sells for $89.95.

ANIMATED GRAPHICS FOR ST

Avila Associates, a new company, displayed two new products for the ST at the Atari exhibit area: Make it Move, a graphics presentation utility featuring animation, and Casino Craps, a gambling tutorial. Both are expected in July. Make it Move lets you grab portions of your DEGAS or NEOchrome pictures and program them into an animated presentation. When we saw it, the program was in the alpha state. Essentially, you can perform functions similar to movie editing techniques, such as wipes, dissolves, fades, cuts and zooms. A single object, grabbed from a screen picture, may be programmed to move along a given path. The same object may also be animated while moving on that path. Rene De La Brandeis, designer of the program, grabbed a section of a NEOchrome picture and saved it in a special compressed format. He then pulled it up with the Zoom utility, set its beginning and ending coordinates and ran it. The object appeared from the beginning coordinates and smoothly grew to full size while following a curved path to the end coordinates. It looked good!

Casino Craps displays a very detailed, and accurate, craps board designed to teach the user to play craps at Harrah's casino in Las Vegas. De La Brandeis is currently trying to get Harrah's name on the product. He hopes they'll want to use it to encourage people to learn the game. These days, the only craps players are World War II vets, according to Harrah's. Harrah's, naturally wants to change this, and De La Brandeis hopes they'll use his game to this end. "It's a lot cheaper way to learn craps," he said.

>anyone else.
>

I think I'm right in saying that Kermit is not public domain, but is
copyright Columbia University. Columbia's policy is that anyone using
or writing a Kermit should make it available to others on request for
no charge (except for postage/handling/media costs). This policy may
even extend to the sources. As I see it, you should be able to pass
the binary on to anyone, provided you don't sell it. Perhaps Neil@Atari
could clarify this ??

BTW, The Columbia CP/M Kermit distribution includes a 'Generic' version
that works on any CP/M machine that uses the I/O byte properly. I have
run it under the ST CP/M emulator with no problem at all... It's actually
a damn sight more friendly than the Dev Kit Kermit and it runs at about
the same speed :-) :-) I guess the limiting factor is disk access time.
Anyone wanna copy ?? I also picked up a PD 8080 assembler and hex loader
from the Kermit distribution. They also work fine under the Emulator...

  We get a lot of Atari postings, but there are other noticeable gaps
in our atari16 contents, like just about anything from Case Western
Reserve. This could be some east-west link problems, since most of
what I see seems to be from the west coast. BTW, did anybody in the
west get the ProGem articles 4-9? We still haven't seen them.

It is now time for me to take the plunge and replace my 300 baud modem with a 1200 baud one. Does anyone have any experience with, or hearsay evidence about, the Avatex 1200 baud modem? It operates at either 300 or 1200 baud and retails through a mail-order house for $89, making the Avatex the least expensive 1200 baud modem I have seen so far. We own an Atari 520ST with upgrades of TOS in ROM and 1 Mb of memory.

Send email, and thanks for the comments.

I didn't read the news for a couple of days so apparently all parts
of Kermit except part 3 got erased from our system before I got them!

Could someone close who got the whole thing mail me a copy. Please send
me mail if you can send it and I'll pick the closest site to prevent
multiple copies.

Thanks,

I was talking to the folks at CompuClub in Framingham MA a couple of days ago
and learned that they are offering the 520ST with one disk drive and a

monochrome monitor for $499 for a limited time. I believe this is the same
price offered recently by 47th Street Computers. CompuClub said the price
resulted from a special sale price from Atari.

CompuClub can be reached at (617) 879-5232 or (800) MY-ATARI. The proprietor
is Tom Graziano. Hours are 11 AM to 7 PM weekdays.

They also do upgrades, and I believe they quoted me $145 additional to make
the 520 into a 1 Meg unit.

Does anyone use their ST as a terminal. How about a good terminal emulator
which runs at 9.6K, 19.2K, or even better 38.4K baud. What about screen
size, I want some thing larger than 24x80 how about 66x132. Any chance of
the Atari ST running UW, the UN*X windowing system for the Macintrash
written by John Bruner.

I have been look at the ST since it first came out, waiting for more info
about the 32 bit box. If I could use the Atari for a terminal at work I
it would give me a excuse to get one now. A 520ST monochrome package is now
the about same price has a Wyse 60.

----
thanks,
Dan Reading

XThis the first version of xmdm:
X
```

X   Features:
X   - Keeps up with high speed serial lines
X   (tested upto 19.2K Baud lines)
X
X   - Does'nt send ANY Xon/Xoff's in the terminal
X   emulation mode to the host. This is important
X   to us as we are all Emacs fans.
X
X   - Supports all baud rates.
X
X   - Ascii file capture.
X
X   - Xmodem Send/Receive.
X
X   - Uses large Rs232 receive buffer.
X
X   - Uses large file buffers. Will not beat your disk
X   drive to death like STTALK.
X
X   - Uses 2 screens. All local functions (prompts etc) are done
X   on a on one screen, and all host communication
X   appears and the other screen.
X
X   - Uses very conservative timeouts/retries figures.
X   Good for dealing with dogs like CompuServe.
X   If you have a very responsive host, then it does'nt
X   matter anyways.
X
X   - PD, share it with your friends. Only thing we ask for is
X   your comments, bug reports (& fixes). Of course we
X   are not in anyway responsible for any brain damage
X   it may cause.
X
X   Known Bugs:
X   - Send spurious characters when it changes Rs232
X   parameters (Baud rate, Flow Control). Normally this
X   does not cause a problem, just hit a return when you
X   get back to your host.
X
X   - When switching screens, it always homes the cursor.
X   (We would appreciate if anyone could tell us how to
X   fix this. What we are doing in the Code (routines
X   his_screen & my_screen) is pushing the cursor,
X   changing screens, doing local functions, changing
X   back to the old screen, and doing a pop cursor. The
X   HH guide says that the vt52 emulator is only reset
X   when you change rez.) This does cause inconvenience.
X
X   - Has not been extensively debugged!
X
X   - Sketchy documentation.
X
X   So why are we posting it?

```
X    To get your feedback on the general scheme of things (interface
Xetc.) and suggestions to fix the above bugs.
X
X    Coming Up:
X         - Kermit transfers, and remote server support.
X
X         - Key Macros and binding of keys to functions.
X
X         - Dialing Directory.
X
X         - dir, space, remove, rename, cd, change drive
X           functions.
X
X         - Code needs cleaning up.
X
X    Not coming up:
X         - Ascii file transmit. We do not see a need for this.
X
XTo compile and link:
X    Compile each .c to get  .o's
X
X    link68 [u] xmdm.68k=[gems|gemstart], <all the .o's>,osbind.o,gemlib
X    relmod xmdm
X
XIf you use gemstart, then the stack+heap size must be appropriately
Xmodified. I use 16K.
X
X    get rid of xmdm.68k
X    rename xmdm.prg to xmdm.tos to use from the desktop.
X
XUSAGE:
X    Double click on xmdm.tos and follow the first prompt that
Xcomes up. Hit the <help> key at any time to get back at this menu.
X
XCapturing files:
X    Hit the <help> key, then choose the function 'c' for capture
Xtoggle. Give it a file name when it asks for one.
X    All host data will be captured from now onwards.
X    To end capture, hit <help> and choose the function 'c' again.
XThis will terminate the capture and close the file. Capture is also
Xterminate automatically when you choose any of the Xmodem functions,
Xon file errors, or when you exit the program.
X
XXmodem send:
X    Prepare your host to receive a file using xmodem. Hit the
X<help> key. Choose the 's' function, for xmodem send, and give it a
Xfile name. If you want to terminate at this point, hit return instead
Xof entering a file name. After the transfer has begun, you may
Xterminate the transfer at any time by hitting CTRL-C.
X
XXmodem receive:
X    Prepare your host to send a file using xmodem. Hit the
X<help> key. Choose the 'r' function, for xmodem receive, and give it a
```

```
Xfile name. If you want to terminate at this point, hit return instead
Xof entering a file name. After the transfer has begun, you may
Xterminate the transfer at any time by hitting CTRL-C.
X
XExiting xmdm:
X    The program may be exited at any time by hitting the <undo>
Xkey, except in the middle of Xmodem transfers.
X
XChanging baud rates:
X    Hit <help> then choose the 'b' function and make a selection.
X
X    Currently only the baud rate can be changed by the user. The
Xother Rs232 port parameters cannot be changed.
X
XPlease send you comments / bug reports and fixes to:

This program, which features XMODEM protocol and ASCII text capture,
was posted some time ago.  Also, I have a modified version which features
```

function key support. Let me know if you would like that copy as well.
Original credit should go to:

              Jwahar R. Bammi

XThis the first version of xmdm:
X
X    Features:
X         - Keeps up with high speed serial lines
```

```
X             (tested upto 19.2K Baud lines)
X
X        - Does'nt send ANY Xon/Xoff's in the terminal
X          emulation mode to the host. This is important
X          to us as we are all Emacs fans.
X
X        - Supports all baud rates.
X
X        - Ascii file capture.
X
X        - Xmodem Send/Receive.
X
X        - Uses large Rs232 receive buffer.
X
X        - Uses large file buffers. Will not beat your disk
X          drive to death like STTALK.
X
X        - Uses 2 screens. All local functions (prompts etc) are done
X          on a on one screen, and all host communication
X          appears and the other screen.
X
X        - Uses very conservative timeouts/retries figures.
X          Good for dealing with dogs like CompuServe.
X          If you have a very responsive host, then it does'nt
X          matter anyways.
X
X        - PD, share it with your friends. Only thing we ask for is
X          your comments, bug reports (& fixes). Of course we
X          are not in anyway responsible for any brain damage
X          it may cause.
X
X    Known Bugs:
X         - Send spurious characters when it changes Rs232
X        parameters (Baud rate, Flow Control). Normally this
X        does not cause a problem, just hit a return when you
X        get back to your host.
X
X        - When switching screens, it always homes the cursor.
X        (We would appreciate if anyone could tell us how to
X         fix this. What we are doing in the Code (routines
X         his_screen & my_screen) is pushing the cursor,
X         changing screens, doing local functions, changing
X         back to the old screen, and doing a pop cursor. The
X         HH guide says that the vt52 emulator is only reset
X         when you change rez.) This does cause inconvenience.
X
X        - Has not been extensively debugged!
X
X        - Sketchy documentation.
X
X    So why are we posting it?
X    To get your feedback on the general scheme of things (interface
Xetc.) and suggestions to fix the above bugs.
```

```
X
X    Coming Up:
X         - Kermit transfers, and remote server support.
X
X         - Key Macros and binding of keys to functions.
X
X         - Dialing Directory.
X
X         - dir, space, remove, rename, cd, change drive
X           functions.
X
X         - Code needs cleaning up.
X
X    Not coming up:
X         - Ascii file transmit. We do not see a need for this.
X
XTo compile and link:
X    Compile each .c to get  .o's
X
X    link68 [u] xmdm.68k=[gems|gemstart], <all the .o's>,osbind.o,gemlib
X    relmod xmdm
X
XIf you use gemstart, then the stack+heap size must be appropriately
Xmodified. I use 16K.
X
X    get rid of xmdm.68k
X    rename xmdm.prg to xmdm.tos to use from the desktop.
X
XUSAGE:
X    Double click on xmdm.tos and follow the first prompt that
Xcomes up. Hit the <help> key at any time to get back at this menu.
X
XCapturing files:
X    Hit the <help> key, then choose the function 'c' for capture
Xtoggle. Give it a file name when it asks for one.
X    All host data will be captured from now onwards.
X    To end capture, hit <help> and choose the function 'c' again.
XThis will terminate the capture and close the file. Capture is also
Xterminate automatically when you choose any of the Xmodem functions,
Xon file errors, or when you exit the program.
X
XXmodem send:
X    Prepare your host to receive a file using xmodem. Hit the
X<help> key. Choose the 's' function, for xmodem send, and give it a
Xfile name. If you want to terminate at this point, hit return instead
Xof entering a file name. After the transfer has begun, you may
Xterminate the transfer at any time by hitting CTRL-C.
X
XXmodem receive:
X    Prepare your host to send a file using xmodem. Hit the
X<help> key. Choose the 'r' function, for xmodem receive, and give it a
Xfile name. If you want to terminate at this point, hit return instead
Xof entering a file name. After the transfer has begun, you may
```

```
Xterminate the transfer at any time by hitting CTRL-C.
X
XExiting xmdm:
X    The program may be exited at any time by hitting the <undo>
Xkey, except in the middle of Xmodem transfers.
X
XChanging baud rates:
X    Hit <help> then choose the 'b' function and make a selection.
X
X    Currently only the baud rate can be changed by the user. The
Xother Rs232 port parameters cannot be changed.

>except for the question of memory. You see, the Smalltalk image alone (ie.
>without *any* code to execute it) is well over 900K long, so unless we can
>expand memory to at least 2Meg, we can't use them.

According to Abacus literature, the ST series is capable of supporting
4 megabytes, using 1 megabit chips. Caveat here, these must be 1meg by X
not 256x4 or some similar arrangement. There are 20 address lines plus
two RAS and two CAS lines. The MMU doesn't know how to handle 4 banks
of 256x16, but it does appearantly know how to handle 1megx16.

There is no question that, using 1meg by X chips, you can get at least
2 meg stuffed in there. You could simplify things by getting SIP hybrids.

>   So... My question is: What is the current (read: "Right Now!") limit on
>the amount of expansion memory which is supported by the ATARI?

If you are willing to rebuild the ram banks completely (modest price, some
labor), you can safely get 2 meg for sure. Getting 4 meg depends on
current requirements of the rams, access times, and general loading/timing
requirements of the 1 meg chips.

>   By the way, an offshoot of this project would probably be a working
>Smalltalk for all ATARIs (Once it works, we could always prune it down to
>fit).

Looking forward to it.

ATARI: Have you started putting the holes for the SIP rams onto the
board yet? I realize that actually putting SIPs into the holes would
be too expensive, but it would make atari ram expansion < $70/megX16, and
MUCH easier.

I assume you've calculated the trade-offs between SIP hybrids and
"building your own" RAM banks, just out of curiosity, how much of
a difference was there (effect on retail price)? The cheapest ram
boards I've seen were $100/megabyte, most of the hybrids seem to be
priced around $50/megabyte.

Right now, the main weakness of the ST is the difficulty of adding
RAM. The DMA port could be used for "Paging", but there is no support
for such paging.

Summary: Looks promising, any reviews?, info?

In the June "Nanobytes" section of Byte, there was a little
blurb on a product called MicroRTX now available for the
Atari. Appearently, it is a superset operating system that
can be put on top of GEM, meaning that current ST software
can be run in a multi-tasking environment.

Has anybody tried this? Has anybody seen any reviews?

I could really use a 12 bit A/D and D/A for my 520 ST. Is there any
interest in a product like this? Is there anything available, or soon
to be available? A good data acquisition add on could turn the ST's

into a great instrument controller and lab tool. The ST's are well
suited to data reduction, number crunching, and displaying results.

Keywords: Ethernet connection, 68k, Atari ST, Mac
Xref: watmath net.micro.68k:1706 net.micro.atari16:1133 net.micro.mac:6713

I'm interested in information about Ethernet boards for 68k based
computers. The possibilities under consideration include a
68k based single-board computer with a VME (or some other 'standard')
bus, an Ethernet connection for an Atari 520ST, or a connection for
a Mac.

So, netters, I'd like to know if any of you have a) hooked up your
ST to ethernet; b) hooked up your Mac to ethernet (as an aside, does
the Mac+ have any kind of a standard bus?); c) hookup up a single-board
68k computer to ethernet.

If either b) or c) have a standard bus, we have a source for the
ethernet boards. So, I'm interested in cheap (< $1k) 68k boards.
Since Atari ST's are about $800, if there are boards available
that would be nice too.

Please send email to one of the addresses below...I'll summarize
to the net if there seems to be much interest.

Thanks in advance,

sc

I have been using an Avatex 1200 baud modem for about 3 months now, and it has worked flawlessly. I have not used the autoanswer feature. I have used the autodial capability and it works as advertised. The switches on the back came in handy to force the modem on-line with one terminal emulator program which apparently did not assert Data Terminal Ready. These switches allow you to choose whether to force these lines ON or let the program do it.

The unit not only works well, it looks very professional too. It is a heck of a lot of modem for the price. Incidentally, the guy I bought mine from charges $80 if you pick it up and I believe he has quoted several people $85 if he has to bother to ship it. For further information, call Rick Pommet, Nelson Data Communications, (617) 667-4357 or 738-6000. The first number is his home phone, and you will have better luck reaching him if you call there after about 7 or 7:30 PM. The 738-6000 number is at work and he is hard to reach there so you will be likely to waste a call if you try it. Rick is an Atari freak of long standing, having had several of the 8-bit machines for years, so he is not out to make a lot of profit on fellow Atari fans.

Another source is Paul Swanson, who uses the name Nite Lite Systems. (He is well known in the Atari 8-bit world for his BBS software under this name so he continues to use the name.) Paul makes his living as an Atari dealer, so tends to charge higher prices than the mail order places. However, I believe his price is still under $100, so if he has them and the others are out of stock, it may still beat waiting for a modem. Besides (see below), he is in a position to provide technical help that you won't get from other dealers.

It just might pay to have him as a friend. Paul can be reached at (617) 663-4463 or via his BBS (running on an 8-bit Atari) at 663-4221.

NOTE: Paul also does 520 upgrades to 1Mbyte and is a 520 dealer for both sales and repair. Also, he is about the highest-grade source of technical information (hardware and software) on Atari products I have found. Keep his name and phone numbers on file -- you will see why if you ever need to call on him for help.

If anyone prefers to order by mail, I could attempt to get mailing addresses from Rick and/or Paul.

  I, too, would pay more money to get rid of a few problems. It was not great to get the TOS in ROM and try my favorite bug-hunting procedures only to find most of the bugs still there. It was great to liberate that memory, and it was well worth the cost to get the quick reboot time, but there are still bugs there. Hell, I/O redirection doesn't even work sometimes now. And I agree it would be great to get the ability to drop a 68010 in there. (I'll wait awhile for the '020 : I heard yesterday that it is priced at $530 CDN for the 12.5 Mhz part.)

  BTW, anybody got a definitive list of bugs in TOS?

I, too, have the Avatex 1200.  It is a remarkable value that does exactly
what it is advertised to do.  BUT, I do have one minor complaint.  It does
not have a built in audio monitor.  The Hayes modem I use at work has this
function and once used to it...

It does allow a phone to be connected to it, so through carefull handling,
I can monitor the beginning of the call without *hanging up on myself :-)*

A couple of times I have called a worng number by accident.  If I hadn't
been monitoring, I would have had an irrate housewife complaining about
crank calls.

Disclaimer:  I speak only for myself

[munch, munch]

We are looking into doing some development on the ST and are faced with
a problem, finding a development environment that suits our needs.
We are thinking of porting a very large application from the PC to the
ST and need to find a dev. system that can hack it.

We prefer a cross-development system, running under UNIX, but I fear
such a beast does not exist.

Our needs are: more than 32k static initialized data (we have lots of
tables), a good pre-processor (handles #if defined(X) || defined(Y), etc)
unsigned as an attribute, rather than as a type of int (we need unsigned
chars), a reasonable debugging environment (compatible with SID, or
better).

Above all this, we need a reliable compiler/linker. We do NOT want to
spend our time debugging the tools.

We have looked at Alcyon (which is what we are using until something better
comes along), but alas it is buggy. SID provides a reasonable debugging
environment. The compiler and linker are slow, and the resource
construction set bombs routinely. We have ordered the new release
of Alcyon, and hope that the compiler bugs will be fixed.

We have also looked at Megamax, but it does not support a debugger of any
kind, and debugging with printf's on a project like this does not appeal
to us... It also does not support more than 32k static initialized data
(we could get around that if we had to)

Ideally we would like the whole system to run under UNIX (Xenix on an AT,

actually), producing a .prg there and then downloading the binary to the ST. Has anyone hacked SUMac to work with the ST ?

Am I hoping too much ? Does anything come close to this ?

Any suggestions would be appreciated,

Regards,
David Rowley

Can anyone shed some light on the format of the Music St*dio song file format. I would like to extract the MIDI data and timing information and convert this information to a form suitable for loading into a stand-alone MIDI sequencer for live performance without a computer. Any help will be appreciated. Thanks in advance.

As I was told by the author, there is a bug in GEM-Kermit 1.1.
REAL binary transfer (definitely non ASCII) does not work. Transfer
of ASCII-Files in binary-mode does work.

This bug is fixed with GEM-Kermit 1.2.
I'll post an uuencoded GEM-Kermit 1.2 to net.micro.at16, soon.
Sources on request.

It seems that our copy of the GEM-Kermit #2 uuencoded executable was
truncated somewhere. Could someone mail me a good copy?

    Thanx,

I fail to see the attraction of the 68010. It's not substantially faster,
and the few extra instructions it offers are unlikely to do a great deal
in speeding up programs. The major virtue of the 68010 is that it supports
demand paging, which is useful in virtual memory systems. The existing
ST MMU renders this advantage dubious.

The 68020 adds a fair number of instructions (notably 32-bit multiply and
divide), and is in general a winner. On the other hand, there is little
point in trying to add a 68020 to the ST directly, so I'm eagerly awaiting
the TT box. Neil Harris, are you listening????

I'm dubious about a $530 CDN price for the 68020, though: the July issue of
BYTE has an article on the Definicon 68020 co-processor board for the IBM
PC. Including 1MB of memory, a 68020, and a 68881 (FPU), the price they list
is US$995. That would cause me to guess that (in reasonable quantities) you
can get a 68020 for ~ $150 US.

X.PART XIII A New Form Manager
X.PP
XThis  is  the 13th installment of ST PRO GEM,  and the  first
Xdevoted to explaining a large piece of code.  This article is also
Xthe  second  in a series of three concerning  GEM  user  interface
```

Xtechniques. The code is an alternate form (dialog) manager for XGEM. It is stored as GMCL13.C in DL3 of PCS-58. You should go Xand download it now, or you will have no hope of following this Xdiscussion.
X.PP
XWhat is unique about this version of the form manager? XFirst, it implements all of the functions of the standard GEM Xform_do routine, as well as adding a "hot spots" feature which Xcauses selectable objects to become mouse-sensitive, just like Xthe entries in menu dropdowns. The second (and obvious) Xdifference is that this form manager is provided in source code Xform. This gives you the freedom to examine it and change it to Xsuit your own needs.
X.PP
XI have several purposes in presenting this code. It is Xintended as an example of GEM program structure, and an Xapplication of some of the techniques presented in earlier Xcolumns. It is also relevant to the continuing thread discussing Xthe necessity of feedback when constructing a user interface.
X.PP
XAlso, this issue represents the beginning of a fundamental Xchange in direction for ST PRO GEM. Since this column began last XAugust, Atari ST developers have increased not only in number, but Xin sophistication. A number of books, as well as back issues of XST PRO GEM, are now available to explain the basics of the ST and XGEM. Quick answers to common questions are available here on XCompuserve's PCS-57 from Atari itself, or from helpful members of Xthe developer community.
X.PP
XTo reflect these changes, future columns will discuss more Xadvanced topics in greater depth, with an accent on code which can Xbe adapted by developers. The program presented in this issue Xwill be a basis for a number of these discussions. There will be Xfewer "encyclopediac" treatments of AES and VDI function calls. XFinally, to give me the time required to create this code or clean Xup tools from my "bag of tricks", ST PRO GEM will probably convert Xto a monthly format around the start of summer.
X.SH ON WITH THE SHOW
XTaking your listing in hand, you will Xquickly notice two things. First, this program uses the infamous Xportability macros, so that it may be used with Intel versions of XGEM. Second, the routines are arranged "bottom up", with the main Xat the end, and subroutines going toward the beginning. (This is Xa carry-over from my days with ALGOL and PASCAL.) You should now Xturn to the form_do entry point near the end of the code.
X.PP
XOne change has been made in the standard calling sequence for Xm_do. The starting edit field is now a pointer to a value, Xrather than the value itself. The new form_do overwrites the Xinitial value with the number of the object being edited when the Xdialog terminated. Using this information, your program can Xrestore the situation when the dialog is next called. As before, Xif there is NO editable field, the initial value should be zero.

X.PP
XThere are several local variables which maintain vital state
Xinformation during the dialog interaction. Edit_obj is the number
Xof the editable object currently receiving keystrokes. Next_obj
Xis set when the mouse is clicked over an object. If the object
Xhappens to be editable, next_obj becomes the new edit_obj.
X.PP
XThree variables are associated with the "hot-spot" feature.
XIf hot_mode is set to M1_ENTER, then the mouse is outside the area
Xof the dialog. If it equals M1_EXIT, then the mouse is currently
Xin the dialog. If it is in the dialog, hot_obj indicates whether
Xthere is an active "hot" object. If its value is NIL (-1), then
Xthere is no active object. Otherwise, it is equal to the number
Xof the object which is currently "hot", that is, inverted on the
Xscreen. Finally, hot_rect is the current wait rectangle. If the
Xmouse is outside of the window, then the wait rectangle equals the
Xdialog's ROOT. If there is a current hot object, then hot_rect
Xequals that object's screen rectangle. If the mouse is in the
Xdialog, but not within a hot object, then the wait rectangle
Xdefines the area within which no further collision checks are
Xnecessary. This is arrived at through an algorithm explained
Xbelow.
X.PP
XForm_do's initialization code sets up the hot-spot variables
Xto trigger if the mouse is within the dialog. It also sets
Xstarting values for edit_obj and next_obj which will cause the
Xedit startup code to be activated.
X.PP
XThe main portion of form_do is a loop, exhibiting the type of
Xevent driven structure discussed in the last column. Before
Xentering the evnt_multi wait, the status of next_obj and edit_obj
Xare checked to see if a new object should be initialized for
Xediting. If so, objc_edit is called with the EDINIT function
Xcode. NOTE: the objc_edit calling sequence used in this program
Xdiffers from the one given in the AES manual, which is incorrect!
XYou should check the bindings you are using to be sure they will
Xwork with this code, and modify as necessary.
X.PP
XThe evnt_multi is set up to wait for a mouse click (single or
Xdouble), for a keyboard input, or for the mouse to make a
X"significant" movement, as discussed above. Notice that since
Xform_do is used as a subroutine, it does not handle messages which
Xare normally processed by the main loop of your application.
XNotice that this creates a mode, and that this routine as written
Xhandles modal dialogs. You could, however, use this code as the
Xbasis for a non-modal dialog handler by drawing the dialog within
Xa window, and combining the main loop of form_do with the main
Xloop of your application. (This possibility may be examined in
Xfuture columns. In the meantime, it is left as an exercise for
Xthe reader.)
X.PP
XThe event bit vector is returned to the variable "which".
XSince events are not mutually exclusive, each possible event type

Xmust be examined in turn before returning to the evnt_multi call.
XThe form manager's event handling routines are form_hot, for mouse
Xrectangle event, form_keybd, for character input, and form_button,
Xfor mouse clicks. Form_keybd and form_button are allowed to
Xterminate the dialog by returning a value of false to the loop
Xcontrol variable "cont". If termination is imminent, or the user
Xhas clicked on a new editable object, objc_edit is called with
XEDEND to remove the cursor from the old object. The normal flow
Xof control then returns to edit setup and evnt_multi.
X.PP
XA few cleanup actions are performed upon termination. If the
Xterminating object (stored in next_obj) is not the same as the
Xhot_obj, then a race condition has occured and the hot object must
Xbe cleared with objc_toggle before exiting. After this test, the
Xfinal edit_obj value is passed back via the parameter, and the
Xterminating object is returned as the function value.
X.SH RELAXEN UND WATCHEN DAS BLINKENLICHTE
XForm_hot is
Xresponsible for maintaining on-screen hot-spots, and correctly
Xupdating the internal hot-spot variables. It is about halfway
Xthrough the listing.
X.PP
Xhe first action in form_hot is to determine if the mouse has
Xjust exited an object which is "hot. In this case, objc_toggle is
Xcalled to unhighlight the object and reset the SELECTED flag.
X.PP
XThe current mouse position is passed to form_hot by form_do.
XIt is checked against the root rectangle of the dialog to see if
Xthe mouse is inside the dialog. If not, the program must wait for
Xit to re-enter, so form_hot sets the rectangle and waiting mode
Xaccordingly, and returns NIL as the new hot_obj.
X.PP
XWhen the mouse is within the dialog, a regular objc_find call
Xdetermines the object at which it is pointing. For an object to
Xbe mouse-sensitive, it must be SELECTABLE and not DISABLED. If
Xthe found object meets these tests, the mouse will "hover" over
Xthe object, waiting to leave its screen rectangle. Since the
Xobject might already be SELECTED (and hence drawn reversed), this
Xis checked before objc_toggle is called to do the highlighting and
Xselection of the object, which becomes the hot_obj. (If the
Xobject was already SELECTED, the hot_obj becomes NIL.)
X.PP
XThe toughest condition is when the mouse is within the
Xdialog, but not over a mouse-sensitive object. The regular GEM
Xevent structure will not work, because it can only wait on two
Xrectangles, and there may be many more selectable objects in a
Xdialog tree. I have found a way around this limitation using a
Xcombination of the map_tree utility (introduced in ST PRO GEM #5)
Xwith the principle of visual hierarchy in object trees.
X.PP
XIn summary, the algorithm attempts to find the largest
Xbounding rectangle around the current mouse position, within which
Xthere are no mouse-sensitive objects. It starts with a rectangle

Xequal to the dialog root, and successively "breaks" it with the
Xrectangle of each mouse-sensitive object. The next few paragraphs
Xexamine this method in detail.
X.PP
XSince C lacks the dynamic scoping of LISP, from which
Xmap_tree was derived, it is necessary to set up some globals to be
Xused during the rectangle break process. Br_rect is the GRECT of
Xthe current bounding rectangle. Br_mx and br_my hold the current
Xmouse position. Br_togl is a switch which determines whether the
Xnext break will be attempted horizontally or vertically. After
Xinitializing these variables, form_hot uses map_tree to invoke the
Xbreak_obj routine for every object in the dialog.
X.PP
XBreak_obj first intersects the rectangle of the object with
Xthe current bounding rectangle. If they are disjoint, then
Xneither the object nor any of its offspring can possible affect
Xthe operation, so FALSE is returned, causing map_tree to ignore
Xthe subtree.
X.PP
XThe object is next checked to see if it is mouse-sensitive.
XAs before, it must be SELECTABLE and not DISABLED, and it must not
Xbe hidden (this was checked automatically by objc_find before).
XIf these conditions are met, then the object intrudes into the
Xcurrent bounding rectangle. To maintain the desired condition,
Xpart of the rectangle must be removed or "broken away".
X.PP
XIn many cases, the break operation can be done either
Xhorizontally or vertically. Since we have no prior information as
Xto which way the mouse will move next, break_obj uses the br_togl
Xflag to alternate which direction it will try first. This should
Xyield the most nearly square rectangle.
X.PP
XThe break_x and break_y routines are very similar. In each
Xcase, the segment occupied by the breaking object is compared to
Xthe point occupied by the mouse. If the point is within the
Xsegment, there is no possible break in this dimension, and FALSE
Xis returned. If the point lies outside the segment, then the
Xrectangle may be successfully broken by reducing this dimension.
XThis is done, and TRUE is returned to report success.
X.PP
XThe break_y routine also employs a look-ahead test to prevent
Xa possible infinite loop. It is conceivable, though not likely,
Xthat someone might nest a non-SELECTABLE object completely within
Xanother SELECTABLE object(s). If the mouse point is within such
Xan object, the algorithm will not be able to select a break
Xdimension. In the current version, the mouse rectangle is simply
Xforced to a single pixel for this case. (Note that is is NOT
Xsufficent to simply wait on the non-selectable object's rectangle,
Xsince other SELECTABLE objects may overlap it and follow it in
Xtree order.)
X.PP
XSince map_tree examines all possible objects, br_rect will be
Xthe correct bounding rectangle at completion. Note that you can

Xreadily adapt this technique to other uses, such as hot-spotting Xwhile dragging objects. It is much less demanding of CPU Xresources than other methods, such as repetitive objc_finds.
X.SH WHAT A CHARACTER!
XThe form_keybd routine acts as a filter on
Xcharacter input. When it recognizes a control character, it Xprocesses it and zeroes the keyboard word. Other chararacters are Xpassed on to objc_edit to be inserted in edit_obj. If there is no Xediting object, the character goes to the bit bucket.
X.PP
XThe form_keybd given implements the standard GEM
Xfunctionality with two minor additions. First, a carriage return Xin a dialog with no DEFAULT exit object is taken as a tab. This Xallows <CR> to be used "naturally" in dialogs with several lines Xof text input. Second, tabs and backtabs "wrap around" from top Xto bottom of the dialog, and are done by "walking the tree", Xrather than relying on the LASTOB flag to signal the end of the Xdialog. This allows the new form manager to handle dialog trees Xwhich are not contiguous in memory.
X.PP
XThe code sets up several global variables for use by mapped
Xfunctions. Fn_obj is the output from both find_tab and find_def. XFn_dir is an input to find_tab. Fn_last, fn_prev, and fn_last are Xused while searching for tab characters.
X.PP
XA carriage return results in a search of the entire tree,
Xusing map_tree and find_def, for an object with its DEFAULT flag Xset. Its SELECTED flag is set and it is inverted on the screen to Xindicate the action taken. Form_keybd returns a FALSE to force Xtermination of the main form_do loop. If no DEFAULT is found, Xcontrol passes to the tab code.
X.PP
XThe tabbing procedure is somewhat complicated because the
Xsame code is used for forward and backward tabbing. The old value Xof edit_obj (the object being tabbed FROM) is placed into fn_last. XFn_dir is set to one for a forward tab, and zero for a backward Xtab.
X.PP
XThe general strategy is to scan the entire tree for EDITABLE
Xobjects, always saving the last one found in fn_prev. When Xtabbing forward fn_last is checked against fn_prev. A match Xindicates that the current object is the one desired. When Xtabbing backward the current object is checked against fn_last. XIf they match, fn_prev is the desired object. This procedure Xrequires two passes when the tab "wraps around" the tree, that is, Xwhen the desired object as at the opposite end of the traverse Xfrom the old editing object.
X.PP
XThe result of the tab operation is written back into
Xform_do's next_obj parameter, and becomes the new editing object Xat the beginning of the next loop.
X.SH BUTTON DOWN
XThe form_button procedure is lengthy because it

Xmust recognize and handle mouse clicks on several types of Xobjects: EDITABLE, SELECTABLE, and TOUCHEXIT. The first section Xof code rejects other objects, which cannot accept a click.
X.PP
XThe next piece of form_button makes a special check for a Xdouble click on a TOUCHEXIT object. This will cause the high bit Xof the returned object number to be set. (By the way, this also Xoccurs in the standard form_do.) This flag allows user dialog Xcode to perform special processing on the object.
X.PP
XThe largest piece of form_button handles the various cases in Xwhich the SELECTABLE flag may be set. Setting the RBUTTON (radio Xbutton) flag causes all of the object's siblings in the tree to be Xdeselected at the time the object is clicked. The do_radio Xroutine uses the get_parent utility to find the ancestor, and then Xperforms the deselect/select operation.
X.PP
XIf the SELECTABLE object is not TOUCHEXIT, then graf_watchbox Xis used to make sure that the mouse button comes back up while it Xis within the object. Otherwise, the click is cancelled. Care is Xnecessary here, since the hot-spot code may have already set the XSELECTED flag for the object. (We cannot be sure of this, for a Xrace condition may have occurred!)
X.PP
XIf the SELECTABLE object is TOUCHEXIT, then the application Xhas requested that form_do exit without waiting for the button to Xgo back up. In both this and regular form_do, TOUCHEXIT objects Xare used when you want to provide immediate response (animation) Xwithin the context of a dialog.
X.PP
XThe final parts of form_button do cleanup. If the clicked Xobject was already hot-spotted, hot_obj must be reset to NIL, Xotherwise form_do will carefully unselect the object which has Xjust been selected!
X.PP
XIf the EXIT or TOUCHEXIT flags are in force, form_button Xreturns FALSE to force the completion of form_do. For EDITABLE Xobjects, next_obj is left intact to replace edit_obj during the Xnext loop. Otherwise, next_obj has done its job and is zeroed, Xand form_button returns TRUE for continuation.
X.PP
XThis concludes the tour of the alternate form_do. The best Xcure for any confusion in this explanation is to compile the code Xinto an application and watch how it runs with different Xresources, or attack it with a debugger.
X.SH OPERATORS ARE STANDING BY
XI encourage you to modify this Xcode to meet your particular needs and incorporate it into your Xapplication. I would like to request than anyone who comes up Xwith significant improvements (or bug fixes) send them to me so Xthey can be made generally available. You can do this via the XANTIC ONLINE Feedback, or by sending E-mail to 76703,202.
X.PP

```
XSpeaking  of  Feedback,  I  would also like comments  on  the
Xproposed change of direction for the column,  and more suggestions
Xfor  future  topics.   The  next  installment will  be  a  further
Xdiscussion  of  interface design.   Topics now queued  for  future
Xarticles  include the file selector and DOS error handling,  a new
Xobject  editor,  and customized drag box and rubber box  routines.
XDiscussions  on  VDI workstations and printer output are  on  hold
Xpending  release of the GDOS by Atari.   If there are items  which
Xyou want to appear here, you must let me know!

X.PART XIV USER INTERFACES - Part 2
X.PP
XThis  issue of ST PRO GEM (#14) continues the  discussion  of
Xuser  interface  design which began in episode eight.   It  begins
Xwhere  we left off,  with a further treatment of the mode problem,
Xand  proceeds  into  topics such as visual  grammar  and  layered
Xinterfaces.
X.PP
X     Note  that  there  is  no  download  for  this  column.   The
Xdownloads  will return with the next issue,  a discussion of using
Xthe  GEM DOS file system within a GEM application.   Specifically,
Xit  will include sample code for using the file selector,  the GEM
Xform_error  alerts,  and some utilities for manipulating file  and
Xpath names.  There will also be a feedback section.  The following
Xtwo columns will be devoted to "graphics potpourri",  a collection
Xof  small  but useful GEM utilities such as  popup  menus,  string
Xediting, and source code for drag and rubber box operations.
X.SH MODES AGAIN
XIf a program is modeless, it acts predictably,
Xwhich turns out to be very important.   On the other hand,  a good
Xdefinition  for  "modes"  is hard to find.   In  column  eight,  I
Xsuggested  that  a  mode exists when you cannot  use  all  of  the
Xcapabilities  of the program without performing some  intermediate
Xstep.   If  this  is  less  than clear,  here  are  two  alternate
Xdefinitions offering different views of the problem.
X.SH THE "TWO USER TEST"
XConsider  the  following  thought
```

Xexperiment: Imagine that your ST (and GEM) had two mice, two Xcursors, and two users. Could they both effectively use the Xprogram at the same time? If so, the application is modeless. If Xthere are points where one user can be "locked out" by the actions Xof the other, then a mode exists at that point. Let's consider Xsome examples of this test.
X.PP
XIn any program which uses the GEM menu system, one user could Xstop the other by touching a menu hotspot and dropping a menu. XThis constitutes an inherent mode in the GEM architecture.
X.PP
XOn the GEM Desktop, two users could open windows and view Xfiles without interference. However, as soon as one person tries Xto delete a file (assuming the verify option is on), the other is Xbrought to a halt as a dialog appears. Thus, we have found a Xmodal dialog.
X.PP
XIn many "Paint-type" programs, such as MacPaint, PC Paint, Xand GEM Paint, two artists could co-exist quite well, utilizing Xthe on-screen palette and tool selection. Of course, these Xprograms also contain modal dialogs for such operations as file Xand brush shape selection. In contrast, consider the paint Xprogram DEGAS for the ST. Here, two artists could only work Xtogether as long as neither wanted to change tool or color. Then Xthe display would have to be flipped to the selection screen, Xstopping the other user. This is a mode in the DEGAS interface.
X.PP
X(By the way, this test is not just academic. The grand-daddy Xof all mouse based systems, NLS, demonstrated by Doug Englebart in X1968, had two mice and two users, one of whom was physically Xremote. Cooperative techniques such as this are still largely Xunexplored and unexploited.)
X.SH ONE LINER
XHere's a terse definition by Jef Raskin: A Xprogram is modeless if a given action has one and only one result.
XAgain, let's run a few examples.
X.PP
XThe menu dropdowns are clearly modal by this definition. XBefore the menu was activated, window control points could be Xactivated with a click. However, when the dropdown is visible, a Xclick action is interpreted as a menu selection or a dismissal of Xthe dropdown. Similarly, dialogs are modal because the action of Xmoving the mouse into the menu bar no longer causes the dropdown Xto appear.
X.PP
XI am typing this using the First Word editor program. It has Xa nice desktop level box full of characters where I can click to Xget symbols which the ST keyboard won't produce. However, if I Xinvoke the find or replace string dialog, the click-in-the-box Xaction doesn't work anymore. This is a mode in the First Word Xinterface.
X.PP
XFinally, consider an "old style" menu program, the kind where

Xyou type in the number of the desired action from a list. Since Xthe number "2" might mean "Insert the record" in one menu, and X"Purge the file" in another, such a program is clearly modal by XRaskin's definition.
X.PP
XThese three definitions say almost the same thing, but from Xdifferent viewpoints. Depending on the situation, one or the Xother may be more intuitive for you. The goal of this type of Xanalysis is to root out unnecessary modes, and to make sure that Xthose which remain only appear when requested by the user, offer Xsome visual cue such as a rubber line or standard dialog box, and Xare used consistently throughout the application.
X.SH PREDICTABILITY FOREVER AND EVER AND EVER
XAs Raskin's
Xdefinition makes clear, when the modes go away, the interface Xbecomes predictable. Predictability leads to the formation of Xhabits of use. Habits reduce "think time" and become Xprogressively faster due to the Power Law of Practice discussed in Xcolumn eight. This is exactly what we want!
X.PP
XThere is another benefit of predictability. A habit learned Xin one part of a program with a consistent interface can be Xtransferred and used elsewhere in the application. If several Xprograms share the same style of interface, the same habits can be Xused across a complete set of products. Learning time for the new Xfunctions becomes shorter, and the user is more likely to use the Xnew feature.
X.SH IS A BOGEYMAN!
XMost casual users are scared silly of
Xcomputers and programs. (If you have any doubt, eavesdrop on a Xsecretary with a new word processor, or the doctor's receptionist Xcoping with an insurance data entry program.) In most cases, they Xhave a right to be frightened. Even experienced programmers, Xprone to toss the manuals and hack away, know that moderate Xparanoia is the best way to deal with an unknown program. How Xmust this feel to someone whose ability to perform (or lose) their Xjob depends on an unpredictable (aha!) black box.
X.PP
XSo here's another way in which predictability works. But to Xproduce a truly fearless user, we need other qualities as well. XOne is robustness, meaning that the program will not crash given Xnormal or even bizarre actions by the user. Another is feedback, Xwhich shuts off invalid options, reinforces correct actions, and Xgives reassurance that an operation is proceeding normally. XFinally, we need forgiveness, in the form of inverse operations or XUndo options, when the inevitable mistake is made.
X.PP
XThe ultimate goal is make the program discoverable. This Xmeans the user should be able to safely "wing it" after a short Xsession with the application and its interface. This practice Xought to be considered the norm anyway, since the manual is always Xacross the office or missing when an esoteric and half-forgotten Xfeature is needed. If it is possible to muddle through such a

Xsituation by trial and error, without causing damage, the Ximmediate problem will be solved, and the user will gain Xconfidence.
X.SH GOOD GRAMMAR OR...
XSo exactly what are these habits that are Xsupposed to be so helpful? One of the most useful patterns is a Xconsistent command grammar for the program. This may sound Xstrange, since we have supposedly abandoned command line Xinterfaces in the graphics world, but in fact, the same type of Xrules apply. For instance, in the world of A> we might issue the Xcommand:
X.br
X.sp
X.ce
Xcopy a:foobar.txt b:
X.PP
XBy analogy to Englist grammar, this command contains a verb, X"copy", a file as subject: "a:foobar.txt", and a location as Xan object: "b:". The equivalent GEM Desktop operation is:
X.BO
X- Move mouse to foobar.txt icon in a: window
X.EO
X.BO
X- Press mouse button
X.EO
X.BO
X- Move mouse to b: icon
X.EO
X.BO
X- Release mouse button
X.EO
X.PP
XThe operation can be described as a select-drag-drop sequence, Xwith the select designating the subject file, the drag denoting Xthe operation (copy), and the location of the drop showing the Xobject. A grammar still exists, but its "terminal symbols" are Xcomposed of mouse actions interpreted in the context of the Xcurrent screen display, rather than typed characters.
X.PP
XOne useful way to analyze simple grammars, including those Xused as command languages, is to separate them into prefix, Xpostfix, and infix forms. In a prefix grammer, the operation to Xbe performed precedes its operands, that is, its subject(s) and Xobject(s). The DOS copy command given above is an example of a Xprefix command. LISP is an example of a language which uses Xprefix specification for its commands.
X.PP
XPostfix grammars specify the action after all of the operands Xhave been given. This command pattern is familiar to many as the Xway in which Hewlett-Packard calculators work. FORTH is an Xexample of a language which uses a postfix grammar.
X.PP
XInfix notation places the verb, or operator, between its

Xsubject and object. Conventional algebraic notation is infix, as Xare most computer languages such as C or PASCAL. The example GEM Xcommand given above is also infix, since the selection of a Xsubject file preceded the action, which was followed by the Xdesignation of an object.
X.PP
XThe "standard" GEM command grammar, as used in the products Xproduced by Digital Research, is in fact infix. This is not to Xsay that GEM enforces such a convention, or that it is rigorously Xfollowed. However, when there is no pressing reason for a change, Xadoption of an infix command grammar will make your application Xfeel most like others which users may have seen.
X.PP
XThe general problem of specifying a graphic command language Xcan be difficult, but much of the problem has already been handled Xon the ST. Part of the solution is by constraint: the input and Xoutput hardware of the ST are predefined, so most developers will Xnot need to worry about choosing a pointing device or screen Xresolution. The other part of the standard solution is the GEM Xconvention for mouse usage. I am going to review these rules, and Xthen describe of the situations in which they have been bent, and Xfinally some alternate approaches which may prove useful to some Xdevelopers.
X.SH SPECIFYING A SUBJECT
XThere are really two sets of methods Xfor designating what is to be affected by an operation. One set Xis used when distinct objects are to be affected. Examples are Xfile and disk icons in the Desktop and trees in the RCS. Another Xset of designation methods is used when continuous material, such Xas text or bit images, is being handled.
X.PP
XWhen dealing with objects, a single mouse click (down and up) Xover the object selects it. The application should show that the Xselection has occurred by changing the appearance of the object. XThe most common methods are inverting the object, or drawing X"handles" around it.
X.PP
XMany operations allow "plural", or multiple object, Xselections. The GEM convention is that a click on an object while Xthe shift key is held down extends the selection by adding that Xobject. If the shift-clicked object was already selected, it is Xdeleted from the selection list.
X.PP
XAnother way to select multiple objects is to use a "rubber Xbox" to enclose them. This operation begins with drag on a part Xof the view where no object is present. The application then Xanimates a rubber box on the screen as long as the mouse button is Xheld down. When the button is released, all objects within the Xcurrent extent of the box are selected. A shift-drag combination Xcould be used to add the objects to an existing selection list.
X.PP
XSelecting part of a text or bit plane display is also done Xwith a rubber box. Since there are no "objects" in the view, any

Xmouse drag is interpreted as the beginning of a selection Xoperation. In the simplest case, a bit plane, the rectangle Xwithin the box when the button is released is the selected extent.
X.PP
XWhen the underlying data has structure, such as words and Xlines of text, the display should reflect this fact during the Xselection operation. Typically, text selection is indicated by Xinversion of the characters rather than a rubber box. The Xselection extends along the starting line so long as the mouse Xstays within the line. If the mouse move off the starting text Xline, the implied selection is all characters between the starting Xcharacter and the character currently under the mouse, which is Xnot necessarily a rectangular area.
X.PP
XAn extended "plural" selection may be supported in text Xediting. The use of the shift key is also conventional in this Xapplication.
X.SH ACTION
XWith the subject designated, the user can now choose Xan operation. In many cases, this will be picked from the menu, Xin which case the entire command is complete. Some menu Xselections will lead to dialogs, in which the interaction methods Xare regulated by the GEM form manager. When the command is Xcompleted, it is often helpful if the application leaves the Xobjects (or areas) selected and ready for another operation. A Xsingle click away from any object is interpreted as cancelling the Xselections.
X.PP
XMany operations are indicated by gestures on the screen. XUsually, this is some variant of a drag operation. The Xinterpretation of the gesture may depend on the type and location Xof the selected subject, which part of it is under the mouse, and Xin what location the drag terminates.
X.PP
X"Handles" are small boxes or dot displayed around an object Xwhen it is selected. A drag beginning with the mouse on a handle Xis usually interpreted as a resizing operation, if this is Xappropriate. The pointing finger mouse form is displayed to Xindicate the operation in progress, and a rubber version of the Xobject is animated on the screen to show the user the result if Xthe button were released. In some cases, where an underlying X"snap" grid exists, the animated object may change size in Xdiscrete steps.
X.PP
XDragging a non-handle area of a selected object is usually Xinterpreted as the beginning of a move function. In most Xapplications, a move of a single object may be started without Xpre-selection. Simply beginning the drag on the object is taken Xto imply selection. The spread hand, or "grabber", mouse form is Xtypically displayed during a drag operation.
X.PP
XDragging may denote copying or movement, or more complex Xfunctions such as instantiation or generalization. The operation

Ximplied by movement on the screen will differ among applications, Xand often within the same application, depending on target Xlocation. This target is the recipient of the command's action, Xor its object, in an English grammar sense.
X.PP
XFor example, a drag from window to window in the Desktop Xdenotes a copy. On the other hand, dragging the same icon to the Xtrashcan deletes it completely. Dragging an object from the RCS Xpartbox to the editing view creates a new copy of that prototype Xobject. Dragging the same object within the edit view simply Xchanges its placement.
X.PP
XThere are some mouse actions which are conventional X"abbreviations". A double click on an object is interpreted as Xboth a selection and an action. Usually, the double click action Xis the same as the Open entry in the "File" menu.
X.PP
XWhen the usual interpretation of a drag is movement, then Xshift-drag may be used as an enhanced varient implying copying. XFor instance, shift-dragging an object within the RCS editing Xwindow makes a copy of the object and places it in the final Xlocation.
X.PP
XTo return to the beginning of this discussion, the reason for Xadopting these conventional usages is to build an interface that Xpromotes habits. Particularly, a standard grammar for giving Xcommands helps answer the question "What comes next?". It breaks Xthe user's actions into logical phrases, or chunks, which may be Xthought of a whole, rather than one action at a time.
X.SH DIFFERENT FOLKS, DIFFERENT STROKES
X.PP
XThere are always Xexceptions to a rule, or so it seems. In this case, consistency Xof the interface grammar is sometimes traded off against Xconsistency of metaphor, preservation of screen space, and "fast Xpath" methods for experts.
X.PP
XOne example is the use of "tools" in Paint and Draw programs. XIn such programs, an initial click is made on a tool icon, Xdenoting the operation to be applied to all following selections. XThis is an prefix style of grammar, and stands in contrast to the Xusual method of selecting subject object(s) first. Because of Xthis contrast, it is sometimes called "moding the cursor". (Try Xapplying the tests above to be sure it really is a mode.)
X.PP
XIn these cases, there are two reasons for accepting the Xnonstandard method. The first is consistency of metaphor. The X"user model" portrayed in the programs is an artist's work table, Xwith tools, palette, and so on. The cursor moding action is Xequivalent to picking up a working tool. The second reason is Xspeed. In a Paint program, the "canvas" is often modified, and Xspeed in creating or changing the bits is important. In more Xobject oriented applications such as Desktop or RCS, the objects

Xare more persistent. Speed is then more essential when adding or Xchanging properties of the objects.
X.PP
XWhen command styles are mixed in this fashion, you must Xdesign very carefully to avoid conflicts or apparent side-effects Xin the command language. For example, in GEM Draw picking an Xaction from the Edit menu cancels the current cursor mode without Xwarning. Confusion from such side-effects may cancel out the Xbenefits of the mixed grammar.
X.PP
XThe subject of command speed deserves further attention. XWhile the novice approaching a program needs full feedback, a Xperson who uses it day in and day out will learn the program, and Xwant faster ways to get the job done, even if they are more Xarcane. The gives rise to a "layered" style of interface.
X.PP
XA layered interface is designed so that the visual grammar is Xobvious, as we have discussed. However, there are one or more Xsets of "accelerators" built into the program, which may be harder Xto find but faster to use. One example is condensed mouse actions Xsuch as the double-click. For instance, attempting to select a Xblock of text which extends beyond a window is impossible using Xthe basic metaphor. The novice will simply do the operation in Xpieces. A layered interface might put a less obvious Mark Begin Xand Mark End option in the menus. Another way is to take a drag Xwhich extends outside the window as a request to begin scrolling Xin that direction, while extending the current selection.
X.PP
XOne of the most common and useful accelerator methods is Xfunction keys. Using this approach, single key equivalents to Xactions are listed in the menu. Striking this key when an object Xis selected will cause the action to occur. Note that this is Xmost useful if some keyboard driven method of object selection, Xsuch as tabbing, is also available. Otherwise, the time switching Xfrom the mouse, used to select the object, to the keyboard for Xcommand input, may well cancel any advantage.
X.PP
XFinally, radical departures from the GEM metaphor may be Xuseful when attempting to replicate the look of another system, or Xtrying to meet severe constraints, such as display space. One Xexample would be discarding the standard GEM menus in favor of X"popup" menus which appear next to the current mouse position in Xresponse to a click on the second button. This method has the Xadvantage of preserving the menu space at the top of the screen, Xand is potentially faster because the menu appears right next to Xthe current mouse position. The drawbacks are lack of a visual Xcue for naive users trying to find the commands, and the need for Xcustom coding to build the popups.
X.SH MORE TO COME
XWe have reached the end of the second sermon Xon user interface. In a future column, I will look at "higher Xlevel" topics relating to the design of the application's user Xmetaphor. These include issues of object orientation, direct

```
Xmanipulation,  and  the  construction  of  microworlds.  In  the
Xmeantime,  several  of  the  more practical columns  will  present
Ximplementions  of  techniques such as accelarator keys  and  popup
Xmenus which I have discussed this time.
X.PP
XTHANKS AND APOLOGIES to the following people whose public and
Xpublished  remarks  have  formed  part  of  the  basis  of  this
Xdiscussion:  Jef Raskin, Bill Buxton, Adele Goldberg, James Foley,
Xand Ben Schneidermann.  As always, any errors are my own.

Last night, i left the printer connected to our 1040 here in Zuerich printing
the ProGEM files, what a suprise this morning when I found about 400 to 500
copies of pages 114 and 115 covering more or less everything in our office ,
I used the PRINT option built into the desktop. I can remeber the same thing
happening at home with my 520 using the SHOW options, questions:

- is this a "undocumented feature" (=bug)
- or is it the FAT getting mixed up
- has anybody had the same experience
- if it is a known bug, why wasn't it
  fixed before TOS in ROM's was made available
  here (--> the ROM's arrived here last week ($50 grrrr...))

Both computers have the german TOS version in ROM.

Simon

To all netlanders, (escpecially those interested in trading
files with others on the net.)

Going through the Club II Det userlog recently, we found a large
number of European callers on the Club Network BBS in Detroit.
(Club II) Since it appears international callers seem to have
success calling the II, and the II (so far) can afford the
luxury of giving it's callers 40 minutes online (as opposed to
20 on the Atari lines) we submit a request that netters drop
a copy of source and executable code online the II for a
"European window." To back it up, we will expand the system
as usage demands up to 6 lines and 100 meg storage to handle
the load.

      The Club II is available at
     US area code (313) 334-8877

Other Club net nodes transfer all ST files to the II, so
it's probably the best place to start. Hope this helps as
the binary posting are not always workable (for me for example!")
but with kermit, Xmodem, Xmodem CRC and a few other we -should-
have whatever you're fond of as a transfer option. Good luck.

              Terry Conklin
             Club Lans - coordinator

In the this area (W. NY) the only part of GEM-kermit that made it was part
3. I did not miss the other parts, they simply never came. Could I
suggest to the author to resubmit the articles to mod.sources? The
moderator can make sure that all the nicities (SP?) of 'netocol' are
observed giving most folks a decent chance of receiving the 6 parts
intacted.

To the author: If you agree, I believe the address to mail the postings to
is:

When I uudecoded this on Unix I got an error message stating that there was no 'end' in the file. As it turned out the end was there but the file had a CR/LF at the end of each line instead of just LF. This was what was causing the error. If anyone else had a similar problem, try:

```
tr -d '\015' | uudecode
```

I don't know if this is the problem here, but someone besides myself may have run into it.

Lines: 51

Summary: Public use != public domain.

There are a number of systems, and I believe kermit is one
of them, which are protected under "public use" copyrights.

The main problem here is that when something is put in public
domain, the author gives up all rights, including the right
to control "derivative works", which may not be public domain
OR public use.

GNU and the Free Software Foundation is an example of "public
use" copyrighted material. In this case, you MUST be provided
with the source, you CAN'T make proprietary changes, and you
must include source to any enhancements you make. Ironicly,
FSF does sell GNU products, but doesn't try to charge for
"percieved value", or try to enforce restrictive liscence
agreements. What they are charging for is the basic costs
of distribution, with a small margin of profit. Per user,
a GNU release is about $5/copy. Releases come out frequently,
and there is no "hand holding", but the products released
so far are very high quality. You ARE allowed to give
copies to others, in fact, it's encouraged, but you MUST
include the source.

Some software is along the lines of Kermit. You can give it
away, pass it around, and "throw it in" with other software
packages (like the developers kit), but you can't SELL kermit
by itself.

Many people put copyright notices on their software and then
permit free distribution. It is important to read the terms
of the copyright and abide by them. If you want to improve
and sell something which has a copyright notice attached,
you should contact the author for terms before even starting.
Even if you just want to improve it, contact the author.

It is a good idea to include a copyright notice on anything
you submit anywhere, not because you are greedy, but because
you cannot prevent someone else from using your code for a
commercial product. It is a good idea to include basic
terms, followed by "all other rights reserved".

Ironicly, copying something out of a magazine or a book that
is copyrighted does not make that source "public domain", in
fact, the material may be covered under several different
copyrights (the magazine, the original author, the publisher).
On the other hand, the royalties are often so low, that they
are even practical for commercial use.

See net.legal, read the copyright act of 1978, and "the rights
of authors and artists" to see what the current story on
copyrights is.

John Sangster (jhs@mitre-bedford) has been filling me in on the Avatex 1200 baud modem he uses for his 800XL. Does anyone have any experience with the Avatex on the 520ST??? Specifically, will it work with the VT52 emulator from the desktop? How about any pointers to similarly priced (<$100) modems?

Your comments are appreciated.

I just spoke to Mr. Rick Pommet of Nelson Data Communications about the use of the Avatex 1200 baud modem on the 520ST. He said that he and friends have the Avatex running on their own ST's with no problems; an RS-232-C cable is needed to connect the two. He quotes $85+shipping. How can you beat it?

Mr. Pommet is sending me further information. If there is interest I'll post. Thanks to jhs@mitre-bedford for pointing the way.

$530 CDN it is - single quantity from L. A. Varah, as of 86/06/25. Shouldn't stay that way for long though, I agree.

I quite often see postings from Neil and others @Atari. The postings seem
to come in in bursts, as if Neil catches up once a week...

Our news feed is via UKC via MCVAX via SEISMO (I guess), so we know that
part is functioning OK. Maybe we can track the black hole by a process
of elimination (sort of 'binary chop' :-).

I purchased one out of a group of 10 people. None of them has reported
any difficulty; I used mine to replace our hayes for DIAL-IN on our Unix
system for 2 weeks while the Hayes was out for warranty repair, and am
using the Avatex 1200 now for dial-out from my 520ST.

I recommend it highly for dial-in operation in an unattended mode, or for
dial-out when it is right along side of your 520. Do not expect to find
the full Hayes set -- it does not support any register settings, escape to
command level using "+++", etc, which is why it will work fine for dial out
if the modem is within finger's reach for disconnecting from a line, etc.

We have been deluged with error messages from CSNET-RELAY and rejections
in trying to send messages to BITNET via WISCVM.

From this end it appears that both gateways are having problems.

At this point I have two recommendations:

1. Defer sending mail to info-atari* until we figure out what is
happening.

2. Anyone who knows what is happening, please communicate it to us
at this address.

Thanks,
Your over-worked moderator,
Marshall Abrams

"Jan, how come ``Object hash'' never returns a number larger than 255?"
"Well, it's a long story...you see, back in 1986 my ST only had 1 Mbyte
of RAM..."

>According to Abacus literature, the ST series is capable of supporting
>4 megabytes, using 1 megabit chips. Caveat here, these must be 1meg by X
>not 256x4 or some similar arrangement. There are 20 address lines plus
>two RAS and two CAS lines. The MMU doesn't know how to handle 4 banks
>of 256x16, but it does appearantly know how to handle 1megx16.

A 1 Mbyte DRAM uses 10 address lines, multiplexing the 10 row and 10
column addresses at different times. The multiplexing and other chip timing
is controlled by 1 RAS (row address strobe) and 1 CAS (column address strobe)
line. A 1 Mbyte DRAM requires 18 pins (cf. 16 pins for 256K DRAMs).

The Atari ST MMU has 2 sets of { RAS, CAS-low-byte CAS-high-byte }, so it
can directly support 2 banks of RAM, each of which is 16 bits wide.

>There is no question that, using 1meg by X chips, you can get at least
>2 meg stuffed in there. You could simplify things by getting SIP hybrids.

Since 1 Mbyte DRAMs require 18 pins, you will have to bend up between two and
four pins on each DRAM and route the wires yourself. Minor PCB surgery
(cutting a few traces) will also be required.

SIPS would be *more* work!

Current 1 Mbyte DRAM price: $75US each from Microprocessors Unlimited.
Therefore 2 Mbytes costs $1200, 4 MBytes cost $2400. You'd be wise to
wait a few months, it'll probably be $30 each by 4Q86/1Q87.

>If you are willing to rebuild the ram banks completely (modest price, some

>labor), you can safely get 2 meg for sure. Getting 4 meg depends on
>current requirements of the rams, access times, and general loading/timing
>requirements of the 1 meg chips.

In general, 1 Mbyte DRAMS are faster (100 ns access times), and have roughly
the same current requirements of 256K DRAMs. Should be no problem expanding
to 4 Mbytes (except for piggy backing hassles).

>ATARI: Have you started putting the holes for the SIP rams onto the
>board yet? I realize that actually putting SIPs into the holes would
>be too expensive, but it would make atari ram expansion < $70/megX16, and
>MUCH easier.

Atari will make >200000 ST systems this year. They won't add $1 of cost
(in terms of PCB space) to each one to make a few hundred hobbyists happy.

Apparently Part 3 of 6 was the first, that made it over the atlantic.
Please wait some days for the other parts to arrive, before asking

for repostings. Some people, who reported the receipt of part 3 only,
have finally received the missing ones.

BTW: there is a two-part distribution of uuencoded GEM-Kermit 1.2
in this newsgroup. The respective source (only minor changes compared
to v1.1) will soon be available from kermserv@cunyvm.bitnet. It's
also possible to get there from ARPA, but I don't know how.

Hopefully you've already got everything when you read this.

Over here at usceast (the east coast campus of USC) we have recently made the port of both emacs-3.6 and the public domain text formatter proff to the ST-520.

    Those of you that might like binary's should drop mail at this address and if there is enough intrest I will post them. By the way, I have been using the Micro C-Shell for some time now and those of you with an extra dollar or two should give it a try ---- Just a satisfied customer.

Micro Emacs is great -- we are porting it to the world or what little left there is.

                    Good Luck
                    W.R.Wood

Hello,
     If you can get your hands on a 68k Unix box the compiler just needs to be told to save the relocation information and you have to filter that to look like a Gem program.
     The only problem with this solution is that you get to write your own system calls which I think is worth the price. If you would like to see an example filter, one that converts a Unisoft ld format to a Gem format.
     By the way getting the character oriented stuff is actually pretty easy.
                         Good Luck.
                         W.R.Wood

Hi, all. I don't own an Atari 520 ST but I am considering to get one
for myself. But, before I make any decisions, I would like to ask
you, fellow 520ST owners, to give me an in depth review of ST. What
I am particularly interested in is its software availability, the
basic system - for $499 one that is on NYT - , and its worthness.

I mean if I want to do some programming in C , is it possible without
any software? What are the software that follows with basic system.
Is it fast? Compare to Amiga or Mcintosh, which one do you like?

I heard that the TOS is icon driven; is that true?

Please post. And any help will be appreiated.

Thanks in advance.

Daniel Lee.

I've just stumbled across an 'excerpts from' thingie on this system, and
it looks interesting. Do you know offhand if the info-atari mailing
list includes any of the UK universities, from whom I might be able to
pick it up more locally? Or, alternatively, is there any chance of
being added to the mailing list? I'm not sure of the topologies
involved, but UCL-CS knows us as AUCC. UCL-CS have a number of
gateways, most of which I'm not conversant with, though I believe that
ARPA and UUCP are amongst them -- possibly BITNET as well. In ARPA
address terms, I'm:

   Smee at AUCC via UCL-CS   -- in whatever syntax your mailer users.

Further to this, can you provide any info about who keeps track of the
'net sources' I keep hearing about? Or at least, the Atari flavored

ones? (Mines an ST520...)

  Thanks,
    Paul Smee, Senior Systems Programmer

Hi folks,

        I'm experiencing difficulties with the Intersect Ramdisk.

A) System booting when writing to write protected floppy.
   Here's the scenario:

     I have a 1040 STF with 1 meg Ram and german TOS in Roms. The Ramdisk
   is loaded as accesoire. A write-protected floppy is in the disk drive.

     When I try to write to that disk, a alarm box pops up. When I remove
   the write protection and click "continue", the machine boots. When
   I simply click "abort", same outcome.

B) Ramdisk not releasing all the RAM when removed

     When I remove the Ramdisk, sometimes not all the RAM is freed again,
   so I have to reboot.

Any suggestions/help/hints to the above problems are greatly welcomed.
Also, pointers to the source of the Ramdisk program are appreciated.

Thanks

Summary: Freedom of Choice!

Has anybody noticed or heard of an SCSI interface to the
DMA port of the ST, and if it is available yet?

Atari has been doing a great job of blowing competition out
of the water, but I am still a little concerned about getting
"locked in" to another "Atari Only" selection of peripherals.

A number of drives and peripherals seem to be coming out with
PC, PC-AT, and SCSI interfaces (maybe they'll get smart and
just offer a PC-XX -> SCSI interface and save even more money)

I realize that Atari has a real nice hard disk of it's own,
but there are certain things (like removable high density storage)
that I seriously doubt Atari will even WANT to compete in.

It looks like the ST is becoming a defacto standard but I worry
about the "Commodore comprimises". Remember those S-L-O-W
drives for the 64? Was this Jack's Idea?

With multi-tasking available now, it makes sense to keep the options
for things like WORMS, tapes, CD-Roms, and Networking as open as
possible.

Besides, the ST is looking more and more like a "real computer"
to the rest of the industry (It's about time!!). They might
want to support it, but not if they have to do a "custom interface".

P.S. It doesn't HAVE to be made by Atari, but it would be nice.

I'm looking for a version of MicroEmacs for the ST.

We have the sources for MicroEmacs 3.6 here, but there doesn't appear
to be an Atari ST version. If someone out there has ported 3.6 to the
ST I'd like to know what changes you made.

There was a three part posting recently of (a) MicroEmacs (which one I
don't know), but the posting containing the object file was truncated
when it arrived here.

I have also heard of another version of MicroEmacs (v30?). Has this been
ported to the ST?

If you can help with any of the above, send me mail (rather than entire
sources, or binaries) and I'll use the closest offers.

I have a couple of questions that people maybe able to help me out with...

1) Does anyone have the code to pipe an AES message (specifically a redraw message) to an application. I believe this was mentioned in Tim Oren's Professional GEM column (on CompuServe?) but I don't have it. The code should be pretty short.
2) Has anyone had any trouble using menu_ienable and menu_icheck? I probably forgot to initialize something, and would be open to any suggestions so I can track down the problem. The menu bar is on the screen, and I get menu messages fine, but my menu_ienable calls often cause no results, and sometimes crash with 2 bombs. I created the menu with the RCS. Is there something I don't know?
3) The GEM documentation describes two ways to select a height for a font vst_point and vst_height (or something like that). I want a way to switch between the small and normal system fonts in any resolution, and be compatible with future changes. I can find the cell size of the standard font character when I get graf_handle (or somewhere in the beginning). Anyway...how can I set the size to be this character box. If I use vst_height, I have to specify the distance from the top to the BASELINE, but I only know the cell height. And I can't use vst_point (though this appears to be character cell mode) since this is in printer points apparently. ALL I WANT TO DO IS SWITCH FROM SMALL TO LARGE CHARACTERS!! Am I misunderstanding or what???? Help.
4) What happens if I do a wind_set with WF_WORKXYWH. Will the window be set? I normally use wind_set with WF_CURRXYWN to set the border. Just curious.
5) More coming later ... probably. Thanks for any help.

Question:
How can one get the address of te_ptext, te_ptmplt, etc. of a loaded resource?
Using the rsrc_gaddr call seems to be paradoxical.
It seems that to find the address, one must supply the index number in the
resource file. Problems arise when one discovers that one cannot assign
an index value to anything but a tree or an object in the RCS.

I have tried using (char *)(LLGET(LLGET(OB_SPEC(OBJ)))) to get:
1) the pointer to the ob_spec (OB_SPEC(OBJ))
2) the tedinfo pointed to by ob_spec LLGET(OB_SPEC(OBJ))
3) the te_ptext pointer pointed by tedinfo LLGET(LLGET(OB_SPEC(OBJ)))
4) the string pointed to by te_ptext (char *)(LLGET(LLGET(OB_SPEC(OBJ)))

It would seem to be a waste of memory to have to allocate an array for each
string I wish to copy to. Why not use the space in the resource file?
Also, if I choose to point my tedinfo with LLSET(OB_SPEC(OBJ)), this would
require that I allocate many tedinfo structures, which is a BIGGER waste.

What I desire is to take the persons input from a dialog editable field, and
copy it to another editable field. All I have to do is find out the address
of the te_ptext and I have it made. The rsrc_gaddr call seems cryptic in
trying to get anything but a tree or object.

If you can help, thanks.   I know some hang-abouter from Megamax is out there,
so if you can help.... PLEASE DO.

Thanx,
Michael Vederman

p.s. If I used the C code of the resource, I would have no problem, but...

AHA...
Going over the file stcreate.c seems to have shed some light... the te_ptext, ob_spec, and associated fields are all relative indexes from the beginning of the resource file. It would seem that adding the index to the address of the resource might get the right spot. I have yet to try...
That would explain why the LLGET would not work...
Still, any help would be appreciated.

Thanx,
Mike

6) Does anyone know a way that I can get a character from the system font
into memory so I can blit it, look at the bits, etc.? The only
way I can think of is to print it to the screen and then do
a raster copy on it. But I don't want the user to see the character,
and would rather not do hacks like changing the color registers
so the character doesn't show up. Is there a way to access the
font data legally? Is there some inquire function or something?

~~~~~~~~~~~~~~~~~~~~~~\ lineater, \~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

i have tried MicroRTX and it does work as advertised, i have a demo
of the system which i posted many eons ago and will send you if you
wish. for me the Micro-cshell is the better offering, giving much of
the power and flexibility of UNIX (tm). There is a rumor that they
~~~~~~~~~~~~~~~~~~~~~~

have a device that fits on the bus connector and gives a full SCSI
interface, does anyone know more about this ?????

     I recently discovered a small piece of trivia regarding the 68ohm
resistor debate and the 1 meg upgrade of the 520ST. Recently, I
purchased a 520ST for a relative, and decided to do the upgrade to it
as well (I have an older 520ST and have already upgraded it). Imagine
my surprise when I opened up the new 520ST and discovered that the kind
folks at Atari had "hacked" in the 68ohm resistors into the existing
memory! And when I say "hacked", I mean that they cut traces and soldered
the resistors directly to the ram chips.

     Now, I really don't know what this all means, except that Atari may
have concluded that the resistors are useful. I *don't* think that it means
~~~~~~~~~~~~~~~~~

that those of you that have un-modified 520's should open them up and put them in, but I do think that this indicates that if you are considering doing the upgrade, you should spend the extra $.59 and buy 6-68 ohm resistors.

I have posted the binary of Hack for Atari ST to net.sources.games.

It is Hack 1.0.3 with the updates from Mike Stephenson which he posted recently to the net. I hope that there are not too many bugs in it...

Here is how I would copy from one text field to another using MegaMax C
(which I use every day, by the way!):

```
     DIALOG   *d1,*d2;
     int  dx,dy,dw,dh,dret;

     rsrc_gaddr(0,D1_INDEX,&d1);
     form_center(d1,&dx,&dy,&dw,&dh);
     form_dial(FMD_BEGIN,dx,dy,dw,dh,dx,dy,dw,dh);
     objc_draw(d1,0,MAX1_INDEX,dx,dy,dw,dy);
     dret = form_do(d1,D1TEXT_INDEX);
     form_dial(FMD_FINISH,dx,dy,dw,dh,dx,dy,dw,dh);
     rsrc_gaddr(0,D2_INDEX,&d1);
     strcpy(((TEDINFO *) d2[D2TEXT_INDEX].ob_spec)->te_ptext,
            ((TEDINFO *) d1[D1TEXT_INDEX].ob_spec)->te_ptext);
     form_center(d2,&dx,&dy,&dw,&dh);
     form_dial(FMD_BEGIN,dx,dy,dw,dh,dx,dy,dw,dh);
     objc_draw(d2,0,MAX2_INDEX,dx,dy,dw,dy);
     dret = form_do(d2,D2TEXT_INDEX);
     form_dial(FMD_FINISH,dx,dy,dw,dh,dx,dy,dw,dh);
```

You can get fancy and do the "growbox" stuff, but this is all that I do.
I haven't actually tried this code, so it may have a bug or two...I typed
it in from the top of my head (I was working on dialog stuff last night so
it was still floating around in there!) The only problem that I forsee is
that the second dialog (destination string of copy) should be initialized
in the MMRCP program to be spaces to allocate the memory needed for the
"strcpy". Let me know how it goes...I would be interested in any tips on
how to get the EDIT stuff working...I can only make it work correctly when
I initialize PTEXT in MMRCP with a default string or spaces. Maybe I have
to allocate more memory for it and change the te_ptxtlen (???) value?
Good luck! -- Johnie

Composite signals are made by black magic to fit into a nominal 6 MHz TV channel -- in fact I believe the video portion has to fit into 4.5 MHz. To do this it is necessary to low-pass filter the luminance signal to leave room for the chroma signal, and also to bandpass filter the chroma (or lowpass filter it in baseband form before putting it on the color subcarrier). Anyway, these lowpass operations amount to smearing of detail in the picture or intentionally limiting resolution. Apparently the chroma suffers the worst, which is why in color TV pictures the red areas sometimes appear to be painted on sloppily so they spill outside the area that was supposed to be red.

If you could get the baseband luminance signal out of the Atari before it has been filtered, you might get the resolution you desire. I have no data on the circuit, but maybe somebody out there knows if this signal is available to be brought out. I speculate that it may be available somewhere over on the monochrome monitor output. If it is still active somewhere even when you have plugged into the other jack, you may be able to get access to it.

Too bad they didn't provide an option of 60-Hz standard monochrome output as well as composite.

The other trick that comes to mind is to run your monochrome monitor off the

GREEN output of the RGB output. That is supposed to give a reasonable
monochrome picture for most normal scenes.

Good luck.

From: Stuart Friedberg <stuart>

Back in January, Lee Mondoza reviewed "Atari ST Internals" by Gerits,
Englisch and Bruckman, published by Abacus Software. What I would
like to know from those who have the book and/or a recent developer's
kit is:

1) Is this book still a good addition to the developer's kit?
2) Does TOS in ROM change none/some/most/all of the magic addresses?
3) Does a 1040ST change none/some/most/all of the magic? (The book
   was written about the 520ST)
4) How close is the 20 June 85 BIOS listing in the book to the current
   BIOS? Very close, useful, useless?

For that matter,

5) What is the current state of the developer's kit? What's changed in
   it from the original kits? Has the documentation improved?
6) What other (non-Atari) internals documents are currently recommended?

Keywords: *CHEAP* Hayes 1200 compatible !

  I've tinkered with an Avatex 1200 at the store I work at, and the only difference I've found is that the auto-answer command is different. A friend of mine has been running one on an Apple (gasp! Heresy!) as the base of a bulletin board.. A board written for the Hayes 1200. The modem is mute, however; no onboard speaker, although there is a jack for another phone. Overall: Highly recommended. Price ranging from $90-$110, depending if mail order or not.

A guy I met at a computer store yesterday had a home-built drive consisting of an Atari --> SCSI board, an off-the-shelf SCSI controller, and a 70 meg drive. He got the Atari --> SCSI board and disk driver from Supra for $200.00. I suppose it's the same board that Supra uses in their hard disk for the ST.

He put it together in a weekend, and he said the biggest problem he had was mounting the thing in a box. He also said something to the effect that the Atari --> SCSI board doesn't adhere to the SCSI standard completely, but Supra gives you a list of controllers that work with it. This might just be a driver problem and not the fault of the hardware.

Another drawback is that as it stands you can't boot off the hard disk. You must do a short boot from the floppy drive, and then the hard drive takes over. I'm not sure if GEMDOS has any provisions to auto-configure off the DMA port. I doubt it. The upshod is that you can't call your hard disk "drive A:". Yet another reason to buy the $50.00 upgrade to the developer's kit to get the fixed linker.

I did in fact see the thing work, so if you have some surplus disks or controllers lying about, you might give Supra a call.

While considering the purchase of a 1200 baud modem, I began wondering if there is some optimum data rate for modem operations over the U.S. telephone lines. I have seen a few advertisements for 2400 baud modems, and read mention of 9600 bps modems becoming available. Where does the retransmission rate due to lost bits negate the higher data transmission rate? What might serve to be the most efficient data rate using ordinary (unconditioned) telephone lines? Would the long distance digital telephone trunks be a more serious limiting factor than local or short haul analog lines?

Any suggestions?

If you want to buy ST Intern, you should wait.
In Germany, where this book was produced (by Data Becker, a subsidary of a
West-German firm, which imports usullay American cars), the second edition
of this book is just published. In this second version the bios listing
covers the ROM-TOS version of the Atari OS.

ask and thou shalt receive...

ST Disk Directory

For those of you that have gone from the 8-bit ATARI computers to the 16-bit ATARI ST's, there have been many surprises for you in the past months. Among them is probably " What do I do with all of this extra memory.", or maybe " The graphics on this system sure are something." and one of my favorites, " That disk holds a lot of data."

All of these statements are true for obvious reasons. For the longest time there was only 48K of ram available in the ATARI Systems, so jumping to 512K is a fantastic leap. The same holds true for the graphics capability of the new ATARI, by going to a monitor and improving the resolution, another big leap has been made. But, one of the most important improvements to me has been the disk storage. After using an ATARI 810 disk drive for several years, going to 360K per disk is great.

Now, since I have that off my chest, I would like to go a little deeper and try to explain some of the differences in the way the ST disks (single sided) are handled.

The ST disk is divided into 80 tracks (0 thru 79), 9 sectors per track (1 thru 9), and is written in QUAD density (512 bytes per sector). When a disk is formatted, a Boot sector (track 0, sector 1), the File Allocation Tables (it starts at track 0, sector 2) and the Directory (it starts at track 1, sector 3) are established using all 18 sectors in the first two tracks. The remaining sectors (tracks 2 thru 79, sectors 1 thru 9) are initialized in pairs or by cluster (two sectors = one cluster). As a cluster is initialized the File Allocation Table (F.A.T.) is updated to indicate the status of the cluster; this continues until all 351 data clusters have been completed. If a cluster cannot be formatted or initialized, the corresponding entry in F.A.T. is marked not-available and will remain that way until the disk is re-formatted or thrown-away. If a cluster is marked as bad, the F.A.T. entry will contain a number between $FF0 and $FF7. That range of numbers simply means the cluster is un-usable and will never used to
~~~~~~~~~~~~~~~~~

store data.

The ST disk uses track 2, sector 1 thru track 79, sector 9 to store any files you write to the disk. All filenames are listed on the disk directory in the order they are entered. The directory is seven (7) sectors long and has room for 112 entries, with each entry being 32 bytes in length. Each entry contain the Filename and Extension, the file Attributes, the Time the last change was made to the file, the Date the last change was made to the file, the number of the first cluster in the file, and the length (in bytes) of the file. In addition, there are 10 bytes that have been reserved for future use (see fig.1).

fig.1 ST Directory Fields

1) Filename	8 bytes	bytes 0 thru 7
2) Filename Ext.	3 bytes	bytes 8 thru 10
3) Attributes	1 byte	byte 11
4) RESERVED	10 bytes	bytes 12 thru 21
5) Time of Last Change	2 bytes	bytes 22 and 23
6) Date of Last Change	2 bytes	bytes 24 and 25
7) First Cluster Number	2 bytes	bytes 26 and 27
8) File Size (in bytes)	4 bytes	bytes 28 thru 31

The Filename and Extension are the first two fields in each entry of the directory. They take up the first 11 bytes of an entry and follow the same format as the ATARI 800 or the IBM PC, with one small exception. If the first character of an entry is $E5, the file has been deleted and is no longer available for your use. If no changes have been made to the disk since the file was deleted, it may be possible to recover it by using one of the many sector editors available.

The Attributes field is one byte long and contains a number that indicates any special or unique characteristics about this entry. There are only five bits of the entry used on the floppies at this time, and they are listed in Fig. 2.

fig.2 Attributes

Bit 0 = Read Only (not set if the file is Read-Write)
Bit 1 = Hidden
Bit 2 = System
Bit 3 = Volume Label (Name assigned to the disk)
Bit 4 = Sub-Directory (Folder Name)
Bit 5 = Archive (This will be used on the Hard Disks)
Bit 6 & 7 are not used at this time

The next field is marked RESERVED and is 10 bytes long. This field will be filled with 00's on all disk entries and no plans for its use are known at this time.

The Time of Last Change field is 2 bytes long and is updated each

time you write to a file. This field contains the HOURS, MINUTES, and SECONDS(/2) of the last change to the file. This field is in the low-byte, high-byte format and uses all 16 bits. Starting with the highest bit, it uses 5 bits for the Hour, 6 bits for the Minutes and the last 5 bits for the Seconds. (The value in the seconds portion of the field must be multiplied by 2 to get the correct seconds count.)

The Date of Last Change field is handled almost the same as the previous field. This field is changed along with the Time of Last Change, and is also in the low-byte, high-byte format. Starting with the highest bit, use 7 bits for the Year, 4 bits for the Month, and the last 5 bits for the Day. Don't be to surprised when the year equals a 5 (as most files will) because the year stored has 1980 subtracted from it.

The First Cluster field contains the number of the first cluster used for the file. The cluster information is stored in high-byte, low-byte order and should never go above $15F (351), since there are only 351 clusters.

The File Size field is a value equal to the number of bytes used in the file. This number divided by 1024 (1k) will tell you how many clusters are being used for the file (cluster * 2 = sectors).

The File Allocation Table (F.A.T.) starts on track 0, sector 2, and may be the most important table on the disk. F.A.T. is used to keep track of the sector linkage for all data sectors. It is also used for files listed in Folders (sub-directories, see Attributes). The F.A.T. is five sectors long and is valuable enough to be have a duplicate table on the same disk. The location of the second F.A.T. is currently track 0, sector 7, but that is subject to change at any time.

The best way to think of the F.A.T. is like a puzzle. Each entry of the F.A.T. is 12 bits long (not bytes, bits), and the values range from $000 to $FFF (see fig.3). Byte 0 of F.A.T. tells what density the disk is formatted in ($F7 is normal for byte $00), and bytes 1 and 2 will $FF as they are not used. The rest of the table is used as follows. (I'll be using the F.A.T. from the disk I have been working on for my examples. see fig.3) Before I begin I should point out that 12 bits per entry means that 2 entries equal 3 hex characters (bytes). We will start with bytes 03, 04, and 05 for our first 2 entries (see fig.3). Byte 03 will be bits 0 thru 7 of the first 12 bit entry, and bits 0 to 3 of byte 04 will be bits 8 thru 11 of the first entry. As you can see in the first example, the number is $FFF. In F.A.T., if an entry contains $FF8 thru $FFF it means the cluster is the last cluster of the file (EOF). Also, if an entry contains $FF0 thru $FF7 it means the cluster is not usable for some reason. Now, if you will return to byte 04, you will remember that we have only used 4 bits (0 to 3). Bits 4 thru 7 of byte 04 will become bits 0 thru 3 of the second entry and byte 05 will be used as bits 4 thru 11. This entry indicates that cluster 4 will be the next

cluster for this file and it continues in that manner for the rest of the table.

Now you know what cluster to look at but maybe you want to know which track and sector that is. The quickest way I've come with is one of the following formulas,

a) To convert from Cluster to Track and Sector;

```
( ( ( cluster #  +  9) * 2 ) - 1 ) / 9  = track
( ( ( cluster #  + 9 ) * 2 ) - ( track # * 9 )  = sector
```

b) To convert from Track and Sector to Cluster;

```
( ( ( track #  * 9) + sector # ) - 17 ) / 2  = cluster #
```

A brief explanation.

Data sectors start at Track 2, Sector 1. That means 18 sectors (or 9 clusters) have to be accounted for in the formula. Also there are 2 sectors per cluster so you must multiply by 2 at some point. Here is all there is to it, what cluster is Track 22, Sector 3 ??
I'll put the numbers into the formula.

```
( ( ( 22 * 9) + 3 ) - 17) / 2  = cluster #
      ( ( 198 + 3) - 17 ) / 2  = cluster #
                 ( 201 - 17 )  = cluster #
                      184 / 2  = cluster #
                           92  = cluster #
```

If there had been a remainder, it would have been the second sector in the cluster. Thats all there is to it, but just so you can practice a little, I included a chart with some of the Clusters marked with the Track and Sector (see fig.4).

fig.3 (in hex) -- F.A.T. --

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
0	F7	FF	FF	FF	4F	00	05	60	00	07	80	00	09	A0	00	0B
10	C0	00	0D	E0	00	0D	00	01	11	F0	FF	13	40	01	15	60
20	01	17	F0	FF	19	A0	01	1B	C0	01	1D	E0	01	1F	00	02
30	21	20	02	23	40	02	25	60	02	27	80	02	29	A0	02	2B

HELP.... I am trying to Download binary files from the VAX to my ST and am having no luck whatsoever. I set the terminal emulator (PC/Intercomm) to Kermit Image and am using KERMIT with the -is option to send the file, but alas I have been without success. Am I going to have to wait until I get a copy of UUDECODE for the ST, or is there a secret I am unaware of? Thank you for any help you can give me.

I found a truncated message about someone porting a version
of Smalltalk to a Mac XL at the bottom of gemkermit part2.

I also found gemkermit part 4 truncated and appended to the
bottom of gemkermit part 5.

There is something strange going on, call the Inspector :-)

Keywords: printing

I have just acquired the DEGAS art program (for 520ST) and the
CAD 3D program. If anyone else has these, perhaps you can help
me understand why I can't seem to print the art from CAD 3D.

I can successfully load and use CAD 3D. The printout function
only prints X,Y,Z coordinates. I've read the manual and find
the merest allusion to loading the SUPERVIEW picture file into
DEGAS to actually print the picture. There does not apear to be
a statement of hard fact as to how printing should be accomplished.

If I enter DEGAS and try to load any *.3D pic file, I get an error
message that says something like "file cannot be loaded because the
resolution is not compatible with current setting." Come on, give
me a break! I have a monochrome monitor and I used the file in the
CAD 3D program, but can't use it in DEGAS and I changed nothing.
So what's the problem?

Please send a letter to Atari Customer Relations, 1196 Borregas Ave.,
Sunnyvale CA 94086, Attn: ST BASIC. Your card may have fallen through the
cracks. Just tell us you need your ST BASIC disk and manual.

>   What was the story behind the policy decision to make people who
> already have Atari ST's purchase seperately the GEMDOS in ROM chips?

When you bought your machine, it had TOS on disk, and we let everyone know
that the ROM chip version would cost extra. It cost more for us to
manufacture ST's back then, too.

We would like to replace some ageing 4027 colour displays with personal computers (not necessarily IBM PCs or clones) running an emulation program. Thus, I would like to know if anyone has got such products, and how compatible they are.
All replies welcome; summary to the net if it turns out to be a hot subject.

[]

I'm having a wierd problem. I wrote a little "Hello, world!" program in C, and compiled using the developers kit. From the "command.prg" supplied with the developers kit, I can issue "hello" and get the expected output, but when I try to redirect the output with "hello >outfile", it creates an empty file. I tried sticking in some flushes & stuff, but nothing seems to work. I could swear I had this work once, but it may have been before I got my ROMS. I can redirect output from "dir" commands & such (although dir needs an arguement when trying to redirect) just fine.

Details:
     520ST with 1 Meg upgrade & ROMS.
     Problem occurs with or without ramdisk (512K lmd's)
     linked with:
       link68 [u,tem[m:],s] hello.68k=gemstart,hello.o,gemlib,osbind,libf

Any assistance would be greatly appreciated.

There will be a delay of a few days in copying STarter Kits. A new ST owner in town blew the 1Meg upgrade on the desk that normally holds my 520. Right now the entire room is full of junk waiting for spare DRAMS to arrive and it

is not worthwhile to reconnect just to copy some disks especially since the
DRAMS are expected soon.

Summary: doesn't work for me???

I recently downloaded uudecoded and downloaded this, then I can't boot
from that disk. I uudecoded it on our vax, could that be the problem
or have others had problems with this too.
  This isn't the first time this has happened to me which is why I'm
curious as to whether it's my fault.

                    Thanks

Nf-From: iuvax!franco   Jun 7 14:56:00 1986

STarter Kits are being mailed again. The botched 1MEG upgrade has been fixed. During repair of the ST we hit upon a few things that may be useful to other people attempting the upgrade. I will describe these things below.

This was the most thoroughly botched upgrade I have ever seen or heard about. After the first attempt there were 2 bridges, one burned out DRAM on the lower memory bank, two traces accidentally cut, two new DRAM pins not soldered to old DRAM pins and several cold solder joints. But we found all the problems in two evenings and now the ST is solid as a rock.

The moral: even a thoroughly botched upgrade attempt may be repaired with a little patience, some PD software and a few simple tools - even if you don't know terribly much about how the ST works.

The Tips: (caution - these worked for us but I do not know for sure whether they will work for you)

Note - initially all we got was the "starting pattern" on the screen. The disk drive did not spin.

1. We located the bridges using a 10X magnifying glass with the PC board held up to the light (non component side facing the light while we looked at the component side). The bridges were very easy to spot this way - you will see why if you try it. Using the same technique we spotted and repaired the cut traces.

Note - after repairing the traces and eliminating the bridges we found that the system attempted to boot (disk drive spinning the disk) but bombed with four bombs.

2. We located the faulty DRAM using a VTVM that also measures resistance. We measured resistance between each pin of one of the DRAMS to ground. We found that pin 9 measured 0 ohms while all other pins (except those supplying power) measured about 1000 - 1500 ohms. We noticed that pin 9

of all DRAMs are connected (address line, I think). Careful inspection of the traces connecting these pins suggested that the problem must be a faulty DRAM (no bridges were visible). We isolated the problem chip by cutting the trace connecting pin 9 of the 8th DRAM with pin 9 of the 9th DRAM. By measuring resistance we found the problem chip must be one of the highest 8 DRAMs. Cutting another trace and measuring resistance allowed us to conclude that the problem chip was among the highest 4. After cutting two more traces we knew exactly where the bad chip was.

Note - after replacing the bad chip (and the piggybacked one (soldering the two chips together before putting them onto the board)) and repairing cut traces the system booted but did not recognize the new DRAMs.

3. We found the faulty connections using a public domain memory editor as follows. After booting, we changed the phystop variable (address $42E) from $80000 to $100000 and the contents of the memcntlr variable (address $424) from 4 to 5. This made the ST think it had 1MEG of memory. Next we hit the reset button. The machine rebooted (thinking it had 1MEG of memory) and put the screen bitmap into the upper memory bank (new DRAMs). Now we had a nice pattern of dots, resulting from the flaky connections, on the screen. To find the flaky connections we brushed a toothpick against each DRAM pin until the dot pattern changed. The pattern changed two times (indicating two flaky connections).

Note - after resoldering these connections the ST booted and recognized 1 MEG of memory (and was steady as a rock).

Comment - it may seem to you that we added alot of wires (to repair traces) to repair the ST. Actually the number of wires that we added was small compared to the number of wires that Atari added at the factory! Some of the Atari supplied wires connected to 68 ohm RAS resistors that are recommended for the upgrade (thank you for helping with the upgrade, Atari!)

One of the things that is checked when you try to load a file into
degas is the extension. Just try renaming it to the correct extension
and it might load. Also, look at the technical notes at the back of
the manual, they explain the format used by store files. It maybe
that, your file is stored in a different order like pallette settings
after the graphics data or something.

Summary: Reply to problem with CAD 3D file and DEGAS.

In article <574@tekred.UUCP>, richa@tekred.UUCP (Rich Amber) writes:
> If I enter DEGAS and try to load any *.3D pic file, I get an error
> message that says something like "file cannot be loaded because the
> resolution is not compatible with current setting." Come on, give
> me a break! I have a monochrome monitor and I used the file in the
> CAD 3D program, but can't use it in DEGAS and I changed nothing.
> So what's the problem?
>   Rich Amber
>   Redmond, Oregon (503) 923-4411
>
Not owning either program I can only make this suggestion.
DEGAS saves it's file with the resolution tacked on to the filename
extension. For example xxxxxxxx.PI3 for monochrome (PI2 and PI1 for medium
and low rez).

Try renaming the CAD 3D file from xxxxxxxx.3D to xxxxxxxxx.PI {1 | 2 | 3}

For monochrome foo.3d becomes foo.pi3.

Hope this helps

Do any of you in net land have a document describing the contents of the
printer configuration file needed by ST writer? Better yet has anyone
hacked up a program that edits this file (xyz.dat I believe)?
I'm gonna be getting a new printer and I'll need to modify/create
another file.

< >
   I would like to know if anyone has heard of a C compiler for the ST which
uses 32-bit 'int's. I would like to port a program from VAX to a 1040 ST
(code assumes integers are >= 32 bits long).
For a compiler with 16-bit integers, I could use "#define int long", but
I would still have to be very careful in 'printf' formats, and casting
of function values.

   Please send e-mail. I will post a summary if I get a/some positive
response. Thanks.

TDI Modula-2 for the Atari ST (possibly also for the Amiga) has a
function called DaTime in GEMDOS for getting and setting the time stamp
on a file. I would like to use it for several utilities (for example, a
version of touch(1) on Unix systems), but I cannot get it to work.
Detailed information or a sample of working code would be appreciated.

["Old heros never die; they reappear in sequels" - M. Morecock]

I have got too many requests where I work for a way to turnkey programs that
use GEM (like BASIC, 1st-Word, etc.).  We first tried putting it into an
AUTO folder, but GEM doesn't get initialized before the the program gets
loaded so things look really bad!  Next we tried writing a desk accessory
that loads and runs the prespecified program, but nothing on the pull-down
menus of the program (BASIC) worked.  And exiting the program got a little
messy, it wouldn't finish initializing the system.

Here's what I'd like to see:
A desk accessory that from the desktop, you can select the program that you
```

want to run (save the filename in a data file). Then on bootup on that disk, it will come up in the correct resolution (and colors, mayby) and autorun the preselected file. And upon exiting the program, finish initializing normally.

This program would help a lot of people. A child could put a disk in the drive and turn the power on and presto! Neochrome is on the screen!
(By the way, Neil, any clues as to what the completed version of NEO will contain and when it will be out? I've heard it may contain animation capabilities... will it be free to ST owners or cost what price?)

I hope someone out there can accomplish this challenge.

["Life is full of little suprises." - Pandora]

I.B. Computers in Portland, Oregon, has just released 5 1/4" disk drives for the ST. The double sided 40 track half height drives complete with power supply and ST beige case will sell around $250. They have tried using it with MS-DOS 2.0, 2.1, 3.0, and 3.1 formatted disks off IBMs (and clones) with no problems of file transferring. Atari even has picked up one for review from what I've heard. I've used one to port a 200+ file Dbase II application over to the ST with no problems.

If you are interested in contacting them you can get a hold of them at:

I.B. Computers
1519 S.W. Marlow Ave.
Portland, OR 97225
(503) 297-9427 (voice)

(503) 292-1321 (BBS 300/1200 baud, 24hrs)

P.S. No, I don't get a commision from this!

Hi,

I have just written a 'shell' for the ATARI ST and implemented I/O redirection from the command level. I have a real problem when redirecting stdin as the called program has no way of detecting EOF if the input is from a redirected file. When trying the following:

```
cat < file
```

'cat' just keeps trying to read past the end of file (cat is just a while not EOF getc loop).

I have implemented redirection as:

```
handle = Fopen(filename,R_ONLY);
Fforce(KEYBOARD,handle);
```

Is this OK ? (there is a small problem when the file is closed - I get a never ending bleep from the speeker - it appears as if stdin is not being set back to the console correctly).

The problem appears to be because the GEMDOS call 'READ' ($3F) has no notion of EOF (the manual states that to detect EOF you must compare the size of the file with the number of characters read), so if you open the file with fopen

all is OK as it is taken care of by the library stdio functions.

The only way around this (as far as I can see) is to write my own detect_eof function which would return the standard FEOF if we have a 'real' file, but if we have stdin from the console look for say ^D, else check for EOF on the redirected file. The only problem with this is how do I check a file descriptor to see if it is realy stdin or a redirected stdin ?

Can anybody help me ? I would be pleased of any help.

Thanks in advance,

Andrew Smith (..!mcvax!ukc!kcl-cs!andrew).

Recently I saw an British advertisement offering original ST-models with built in RF modulator, the so-called 520ST-M and 520ST-M+. Seems to me the ideal configuration: use you monochrome monitor for 'serious' work and use your color television set occasionally to test your own color applications and to run commercially available color applications. Unfortunately, STs are not (yet?) being sold here, in the Netherlands, with built in RF modulator.

Can we expect all future ST models to be equiped with built in RF modulators or is it Atari's policy to sell these only in selected regions?

Frans Dorrestein, The Netherlands.

I waited too long to pull the MicroEmacs source off the net (our mailer only
keeps an archive for a few weeks...) Is there a kind soul out there who can
mail me the files? I'll be eternally greatful.

Thanks,

Steve Tynor

xyzzx.dat is generated from xyzzx.txt using the configuration program
stwconf.prg. xyzzx.txt is a normal stwriter format file, it contains
enough comments to easily modify it for another printer. xyzzx.txt and
stwconf.prg are floating around on virtually every BBS. Hope this
helps.

I have received a number of requests for reposting parts of
ProGEM/Proff. I tried to reply to some, but am unable to get thru to
BITNET sites and some of the canadian sites (maybe i am doing
something wrong). I would like to request that you include a return
path to your site from either one of the Usenet backbone sites, or
your Arpa/Csnet address. That way it will make my job much easier, and
i will get fewer 'unable to deliver' messages bouncing back.
Thanks,

I have been reading the Megamax Mini reviews with interest. I agree
100% with the comments about its speed etc. I was just a little
surprised that no one mentioned some of its flaws and better known
bugs.

Flaws:
- I am shocked that no one mentioned the fixed sized 32K text/data/bss
segment code model. Ok you can get around the text segement by using
the overlay (non standard C), but how about data (you cannot malloc
and statically initialize it, so you end up writing a malloc followed
by an init routine). Doing a malloc for each data structure larger can
32k in the bss segement can get painful too, especially when porting
large programs. Anyone who has written a program more than a couple
of line long knows what a headache fixed sized segments can give you.

-Shorts are 1 byte long. One of the entusiasts here just got burned on
that one.

-No forward pointer reference of typedef'ed structures (because of its
one pass nature, and short sightedness of the parser implementor).
This broke a couple of my programs.

Well known errors that come to mind:
- Comparison of floats.
- Sizeof struct arrays bombs compiler.
- I have not been able to try the release version to verify if the
preprocessor errors have been fixed.

I continue to stick to Alcyon with a hard/ram disk. It is very
livable.

I've been having trouble with my ST disk drive recently. The problem is that it would read fine, but cause the system to lock up anytime a write is tried. The system boots up and reads disks (and writes to the ram disk) fine, but if I try to write to a disk, the drive activity light lights up, the drive spins, and then the screen goes white. I must then reset the system to get things going again. The system seems to actually write one sector (if I try to create or rename a file, the system will crash, but the creation or renaming will be there on the disk next time that I bring the system up.)

I have the following configuration:

520ST with 1Meg memory upgrade with 68 ohm resistors
1 Single sided disk drive
Color monitor
TOS on disk
Older brick power supply with one cord coming from each end

Checking the power supplies has revealed the following:

Voltages coming to the disk drive are fine
+/-12 Volt supplies to system unit are fine
+5 volt supply to system unit is +5.33 Volts under load

I do not have easy access to someone else's 520ST system to try different pieces in (they don't seem to be real popular here).

My question is if anyone has any suggestion of what to do. Specifically, could a 5V supply supplying 5.33 cause a problem (I realize that 7400 series IC's are rated only to 5.25, but the rest of the system is working, after all). Is there maybe an RC circuit in the floppy controller that is real sensitive to voltage variations? Or is it maybe just a dirty disk drive ? Any ideas on things to try would be appreciated. Also, does anybody know what Atari does if someone tries to send a 1Meg upgrade 520St for warranty repair work. Do they fix it under warranty, fix it but charge you, or refuse to even look at it?

Any help would be appreciated.

Are people considering to get IP/TCP protocols and their applications running
on Atari ST type of machines, e.g., by porting the (almost) public domain
MIT PC/IP code?

I hope someone can answer these for me (please!):

How can I make backup copies of Final Word (the copy protection gets in the
way)? The add-on manual says I can....

How can I save files to the b drive instead of a (which already has the system
disk in it)?

I appreciate any comments.

You can copy the files individually. This will involve an inordinate
amount of disk swapping unless you have two drives or a RAM disk.
You will still need to insert one of the original disks as a key
when loading Final Word.

I believe a recent Antic Article addresses this very problem.
It gives C source code for a program to convert from color
to mono and back. You will need a C-compiler however to use this,

unless there is an executable version floating around somewhere.

The final version of NEOchrome will indeed contain animation capabilities
and many other new features. We plan to sell this one, though -- it won't
be a freebie any more.

From talking to Atari at the recent Consumer Electronic Show here in Chicago
and from what I have read elsewhere, all future 520ST computers will be
made with the RF modulator built-in but the 1040ST will never have the RF
modulator built-in. Since Atari doesn't make specific models for selected
regions, I'm sure that all regions will get the 520STM version when the

520ST's are flushed out of the pipe line.

Nf-From: megamax!m5   Jun 11 18:50:00 1986

I haven't been able to duplicate the alleged problems with I/O redirection
under Megamax C. Specifically, the following program seems to work:

```
main(argc, argv)
int argc;
char *argv[];
{
     char string[64];

     scanf("%s", string);
     printf("%s\n", string);
}
```

I've tried this as a TTP application from the desktop and from microcsh. It
seems to work with microcsh pipes as well.

Note that `argc' and `argv' MUST be declared. If not, the compiler/linker
will use a dummy version of an internal routine called `argcv'. The dummy
version doesn't do anything. This is documented on page 1-7 of the Megamax
manual.

If anybody has a short program that demonstrates failure of I/O redirection
I'd be happy to look at it.

<Flame On>

I just went out and bought "Temple of Apshai Trilogy" from Epyx and I'm
rather annoyed to find out that it doesn't run with my monochrome monitor.
All I get is the stupid box telling me that it only runs in low resolution.
Since I couldn't demo it at the store where I bought it, all I could do
was read the outside of the box. The only restriction that I could find
says "Disk Requires 512k". When was the last time anyone saw an ST with
less than 512k and no disk drive. Even the instruction inside never mention
the need for a color monitor (not that I could read them until after I bought
the program). I guess I'll just have to give the stupid program to a friend
with a color monitor.

<Flame Off>

Why can't people clearly label the monitor requirements (and TOS rom
requirements, for that matter) of their software on the outside of the
packaging? I certainly won't be buying any more programs unless they
explicitly state that they work with monochrome monitors.

I'm now chasing the last bugs in a new, improved version of microEMACS
that adds many features (e.g. search for complementing bracket)
and also uses the complete ST keyboard (from F1 to Help).
I hope to make it available in a few weeks, perhaps via the
STarter kit (if Kindly Mr. Franco agrees...), in both
C source and executable (Megamax compiled) form.
(My impression is that uuencoding and then netting is unreliable.
It is 44K long, and the source code is about 175K!)

I was at the CES and really enjoyed it but am not in a position to give
any kind of authoritative report. What I would like to see is someone
download the ANTIC reports from CompuServe. There should be one for
each day and they sometimes have a follow-up overall report the following

week. The past several shows someone has always downloaded it. I don't have an account on CompuServe yet (but I will by the next show). Any kind soul willing to download it?

I do not buy "copy protected" software. Hope you all join me on that.
(I still don't have a drawing program on my ST, because DEGAS is too primitive and N-VISION is "copy protected". Any others?)

Will somebody please send me a short example program for which I/O
redirection fails? I can't duplicate the problem.

One thing to check is that `argc' and `argv' are properly declared
as arguments to `main'. If not, then in order to save space, the

compiler will not reference the library routine which interprets
I/O redirection arguments.

Hi,

I have just written a small program which redirects stdin to a file using
the 'freopen' call. Well it works fine. But how do I get stdin back after
finishing writing to the file. Normally one would write:

```
    freopen("/dev/tty","r",stdin);
                ^^^^^^^^
```

on a UNIX machine, but what is the 'filename' for stdin, stdout, stderr,
on the ATARI ?

Thanks in advance,

Andrew Smith.

As an user, answering these two questions may ultimately benefit
you.

1. Would you like to have different colored diskette covers so that
you can more readily distinguish your disks at a glance?

2 a. Would you rather purchase brandless 5 1/4 inch diskettes priced
at 50 cents each, or,

b. purchase brand name diskettes at $1.30 each?

Send your comments to riz@bucsb.bu.edu

Thank you for your co-operation with DISKOVERS, P.O BOX 684, Kenmore Square,
Boston, MA 02215, U.S.A.

I just posted 1stlatex to net.sources. It is a program that
takes 1stword files and translates them to Latex format. It
does most of the drudge work but some bells and whistles might
still be added. The file posted contains source and uuencoded
binary of the program.

Happy typesetting.

[]
    Although these objections hold, I would even overlook
segmentation (!) to get a bug-free (?) malloc() and a 15 sec
compile & link time (on RAM disk). For my (scientific) work,
the worst bug was the floating point comparision bug (it
claimed that -2 is greater than -1). 'Was', because here...
... (ta-da!) is the fix:
    I took a close look, using the mmdis disassembler,
at the double.o file (extracted from the double.l library with
the mmlib program.) Only one (1) byte is wrong, looks like a typo.
In the routine _fcom, where it says BSET #31,D1 it should say D2.
To patch it, use the following 'bth' program (compile it with mmcc).
    Bth.prg translates the bytes of any file into both hex and
ASCII representation. The output can be edited on any text editor,
and then fed into the htb program (posted earlier) to get it back
into binary. (Only the hex part needs to be changed, the ASCII part

is treated as a comment.) (Yes, Virginia, there is no way to assemble
the output of mmdis!)
    In this case, tell bth.prg to read double.l. In the output file,
look (on line 47) for the sequence "46 82 46 83 08 C1".
Change the C1 to C2. Run it through htb.prg to create newdbl.l,
and your done. From now on, mmlink yourprog.o newdbl.l.

```

Hi there!

I ported Hack 1.0.3 to the Atari ST and would like to know, whether
```

anybody is interested in it. Before distributing it I want to add
the mouse as an input-device so that you can play much easier than
only with the keyboard.

I don't know yet how to distribute it, so this note is just to get
some feedback on the issue.

<Thanks to all those who responded>
The responses would indicate that there are two C compilers available
for the ST which use 32-bit integers (int). These are:

Lattice C:
    I have not heard any complaints about the compiler itself. Complaints are
  with the linker. The compiler can produce code files too big for the
  linker. Externals (symbols) are converted to upper case. There are bugs in
  libraries (strncpy mentioned). The linker is slow and obnoxious. But it
  can be interfaced with the DRI loader (if one has it)

Hippo C:
    It has 32-bit integers - nothing else good was said!

I will probably get the Lattice C soon - and hope for the best.

Hi,
    I'm currently working on a project to port a new version of Smalltalk
(examplar-based, multiple inheritance, multiple PROCESSOR, for those who
are interested) to multiple 68000's on the VME bus. Currently we are
doing our development on Apple Mac "XL"s, but we are investigating the
use of other machines (because the Lisas are reaching the end of their
useful lifespan, and support is lousy!).

   The ATARI 1040 (or 520 for that matter) seems like a reasonable choice,
except for the question of memory. You see, the Smalltalk image alone (ie.
without *any* code to execute it) is well over 900K long, so unless we can
expand memory to at least 2Meg, we can't use them.

   So... My question is: What is the current (read: "Right Now!") limit on

the amount of expansion memory which is supported by the ATARI?

   By the way, an offshoot of this project would probably be a working Smalltalk for all ATARIs (Once it works, we could always prune it down to fit).

.Mike

Hi, I wonder if anyone on the net has had the same experience as
me regarding fitting your own drives to a 520STM.
I had three problems (maybe four)

     I) Getting a connector for the drive
          A) buy a second drive cable wit a friend and split it.
     II) Getting a drive to work
          A) Misubushi's just wont work, their spec is identical to
             Teacs which do. (3mS track to track etc)
                    Teacs cost a lot (150 pounds + case and
             PSU).So I used NEC drives (99 pound with case and leads)

     III) Decipering TOS errors
          Q) What does TOS error #35 mean etc (Heeellllllppppp)

Perhaps someone can tell me why that some drives work and some dont
even though on papaer they are identical ? also does anyone have
a list of TOS error codes and ``bomb'' codes (you know when you really
goofed up BOMB! perhaps BOMB BOMB BOMB BOMB ..... crash (after this
your begging the damm thing to give you you files back
YOU: Come on ST you know and I know you've got 36 files on that disk!

ST: TOS error #35!
YOU: All right already just tell me how much space is on the disk?
ST: (flicker flicker .....(isnt it quiet)..... CRASH)
YOU: Arrrghhhhh
)
help with the above will be appreciated

Alun Jenkins ..ukc!kcl-cs!agjenkins

The HARDWARE: Atari 520ST with color monitor, two SS disk drives
               and tos in ROM.

The PROBLEM: None of the code I have received on the net runs.
               It doesn't seem to matter what type of code,
               either. I have compiled c retreived with the ch
               shell stripping off the extra and by hand copying
               the lines of code. I have also uudecoded several
               binaries for the ST using three different uudecode
               programs on two different machines. Also, I
               recently received the "starters kit" (and a
               wonderfull package it is, too. Four disks packed
               to the hubs with great stuff.) but find that most
               of the programs tend to produce two mushroom
               clouds. Just like the programs I write. :-)

The METHOD: I save the net articles to my home directory on
               the UNIX machine at work using an IBM PC-XT
               running a h19 terminal emulator. Then I access
               the UNIX machine at home with the ATARI running
               ST-TALK. I use the capture mode. I don't seem to

understand the xmodem feature of the UNIX machine
and I can't get the kermit in the 520ST developer's
package to work at all.

The QUESTION: Is it just my machine?

The DISCLAIMER: I speak only for mayself. At least my wife
says I don't speak for her. :-)

The THANKS: Thanks.

I recently pulled a basic program from "sources," and tried to
adapt it for Atari Basic (Yech). It bombs out with a "Too many
FOR loops" error. What does it mean?

Does Atari basic look for certain types of errors before it
begins program execution? The first program line contained
"FULLW 2" and CLEARW 2," but neither happened. Just the error.

Is there another BASIC available for the ST? I really don't like
working with the windows. Every program I've written in basic
has a couple of false starts when I clear windows or change
window sizes. I would rather have full screen outputs without
the framed in appearance of the window.

Thanks

Many basic interpreters do a quick scan when you type run, to tie
together for/next loops, def fn - call, and data statements.

As to your particular error, it could mean you have to many for
loops, loops nested too deep, or problems with matching the control
variable on the for/next pair - some require a variable and some
don't.

2 screen savers: the first one cycles thru the palette registers
(you could make this one even fancier, but i've
only got a monochrome set),
the second one turns the internal gereration of the
horizontal and vertical sync pulses off. This results
in a nice black screen, but it also means you lose
the hblank and vblank interrupts.
----->>>any routine in the vblank queue stops
----->>>disk changes will not be noticed
----->>>drives will not be deselected
so dont flame me if you scramble your disk!!
If anybody finds a way of using a timer interrupt
to get around this: tell me!

Use following batch file to assemble and link the programs:

```
as68 -p -l %1.s
link68 [u] %1.68k=%1
rm %1.o
relmod %1.68k %1.prg
rm %1.68k
wait
```

------>>>>>>> read the code and if you don't like it, change it!!!!

Well, it never fails, or at least it never fails me :-), once a silly question is asked, the answer pops up. I posted questions concerning pulling programs off the net and finding I couldn't run them. Fixed that one by using a few more synapse connections.

Capturing files with ST-TALK also captures the command to list the file on the host. Once I stripped the extranious header and footer, the programs ran fine.

I also said that some of the programs in the "STARTER KIT" wouldn't run. Fixed that, too. Bad disk drive.

Shortly after buying the 520, I bought a second SS drive. It was quieter and had a slightly easier-to-use disk release mechanism. The drive had a wide release button directly under the disk openning. The drive became real flaky lately and was eventually replaced by the retailer. The replacement is the same as the orignal, small button, noisy drive; BUT it works and so do all the programs.

Still don't know the answer to my basic question. What is the "Too many FOR loops" error in Atari Basic mean?

Disclaimer: Speech for myself, by myself, and of myself.

Thanks.

H E L P !!!!

I finally received Megamax. It's a nice compiler (although I abhore the editor!).

Problem is, it WON'T compile the uuencode.c and uudecode.c files. The main problem is due to the #include statements, which include files which don't exist (like "pwd").

Since I'm still new to C programming, I don't know how to fix these problems. So, if anyone has some source which CAN compile with Megamax, I'd appreciate receiving them, since some of the files coming through the net are quite useful.

I have been playing around with different filenames and have found that "CON:" seems to cause 'freopen' not to return an error. But upon reading 'stdin' the character '^J' (10) is always returned.

Do I need to do anything else or may there be a bug in the LATTICE 'C' library ?

Thanks in advance,

Andrew Smith.

     YES!!!!!! I am very curious about the system setup you used to
compile it. What C compiler did you use? What type and how many
drives? I've been toying with the idea of porting it myself, but with
only a single ds drive and 360k ramdisk I didn't think it was possible
to compile and link the thing.

                        Phil

The fault lies not with your machine or even you. The two bombs indicate that the problem is a bus error. What it means is that the program you are trying to run expects TOS in RAM not ROM. To see if this is the problem trying booting your machine with a TOS boot disk and then trying to run a program that has previously chrashed with 2 bombs. I had a similar problem with a package I bought on Saturday. It wouldn't work with TOS in ROM but when TOS was in RAM it ran great.

START Vol 1, Number 1 (Summer 1986)

page article

6 EDITORIAL
Explanation of purpose of START and type of market it is marketed for.
8 AUTHORS
A thumbnail sketch of the authors of the articles in this issue including Tom Hudson and Russ Wetmore.
12 CAPTURING MUSIC ON THE ST--A MIDI SEQUENCER by Tom Jeffries

Take advantage of your ST's built-in MIDI interface. This Simple Sequencer lets you record, save to disk, and play-back music created on your synthesizer.

21 STEALING THE ST PRINTER DRIVER by Tom Hudson
This Desk Accessory lets you install your own customized printer driver for either vertical or horizontal screen dumps at the press of the [Alt] [Help] key. Requires TOS in ROM.

29 MOVING 16-COLOR OBJECTS by Joe Chiazzese
Using AL routines within a C structure, this article demonstrates how to move 16-color objects (created with the C.O.L.R. Object Editor) swiftly around the screen.

32 THE DIGITAL MAGNET by David Small
This spectacularly colorful graphics program simulates magnetic field line generation. Works in any resolution.

36 TRACKING THE ELUSIVE GDOS by Tim Oren
A valuable examination of GDOS and metafiles by the programmer who helped write the GEM system.

44 PRACTICAL SOFTWARE FOR THE NON-DEVELOPER by Jack Powell
A quick overview of various Word Processors, Databases, Spreadsheets and Languages available for the ST usrs.

50 DISK INSTRUCTIONS
How to use the companion disk if you bought the magazine and disk combination.

52 SOPHISTICATED TEXT HANDLING by Cory Cole
How to manipulate text in GEM. A thorough investigation of sophisticated text handling.

60 VOODOO COMPUTING by David Small
The pragmatic art of defensive programming.

64 PROCEDURES: AL AND C ROUTINES... by Dan Matejka
These two AL routines, plus a full, C "help" text window modules will speed your programs and make them more professional.

69 CHIPS: OF DIAGNOSTICS AND DEBUGGING by Jim Dunion
A detailed look at the art of debugging the 68000, plus a dream list of what the best-dressed 68000 debugger may be wearing this season.

77 REVIEW: ST ASSEMBLERS by Chris Chabris
A quick look at what is available for the ST.

83 REVIEW: UNIX FOR THE ST by Russ Wetmore
A review of the uses and capabilities of MICRO C-SHELL by David Beckemeyer Development Tools.

88 RESOURSES by DeWitt Robbeloth
A look at the books available for the ST by Abacus and other publishers.

Comments: The magazine is designed for experienced computer users who own the ST computer. It contains high-end information that requires a good grounding in computer fundamentals and practices. The articles do not include program listings that you can type in. They are all included on a disk that comes bound in the magazine if you buy the $14.95 version or that can be bought separately if you just buy the $4 magazine. This is the only issue of the

magazine I plan to submit to the net. If another user wants to
do so, feel free.

Lines: 26
Keywords: I am most interested in finding out a few things about the PC

Board Designer program from Abacus. For those of you interested, the
advertising blurb makes it sound pretty good except for the price ($399).
It does single or double sided boards, with auto routing, and it has
a standard library of symbols but lets you add to them. It produces
output on Epson style printers and one other (I don't remember which).
They are working on (release 4-8 wks) drivers for some plotters.
My questions:

(1) Is this program really any good? Has anyone on the net used it
enough to tell if it works without too many bugs?

(2) Is it possible for the user to write a device driver for some
custom device?

(3) What will the additional device drivers cost?

(4) How suitable is MX-80 2X1 artwork for serious PC work?

I found it hard to get answers to these questions from Abacus.

It looks likely that our 32-bit computer (the "TT") will have a math
coprocessor. The TT is being designed as an add-on box for the ST (through
the DMA channel). It will use the ST's I/O and graphics, but will perform
its own processing and have its own RAM. I will see how much more I can
find out and transmit to you right now -- please don't request more info,
this is all I have to give you right now.

If you mail me a copy on disk, I will place it on the Atari BBS and wherever
else is appropriate (CompuServe, BIX, GENIE, the works). I have already
done this for the "puzzle puzzle" shareware game from Germany.

There is some confusion here about whether the kermit in the developer's
kit is in the public domain. The manual seems to say it is (right on
the title page), but we would like to make sure before passing it on to
anyone else.

To avert any flames about the superiority of xmodem -- some of us work
on Unix mainframes that support kermit but not xmodem, and would like to
use SOMETHING for errorfree downloading from the net.

I have several questions for anyone on the net. Perhaps Neil from Atari
could give us some answers.

1) What CAD programs are available for the 1040ST? I have heard of
   Graphic Artist and a new one from Germany titled "Data Becker". Is
   that the name of the program? How good is it? How good is the
   graphic artist? What printer/plotters do they support? Is a monochrome
   monitor required?

2) I know that Michtron is working on a flight simulator for the ST's. Is there a known date of release? Also, someone mentioned Sub-logic. Are they working on software for the ST?

3) At one of the Winter/Spring shows, I believe CES, it was mentioned that someone had developed a cartridge for the ST called MACartridge allowing ST users with a monochrome monitor to run Macintosh software. What has the outcome been? Has Atari seen the cartridge? Are they for sale? Perhaps someone needs to create a Macintosh-compatible ROM (similar to the PClones) to sell the cartridge.

4) The infamous Atari-IBM box has been talked about for awhile and I understand it was shown at the Hannover Fair in West Germany. How much and when will it be out? Are there options for 5 1/4 inch drives available for the box? I have heard $200 and out by Fall '86, but it is always nice to hear something straight from the horses mouth.

5) The video digitizer was shown at a recent Chicago show. This hooks into the cartridge slot and is compatible with a standard video camera. Anyone know of a price? When to ship?

6) What kind of expansion beyond 1 meg is Atari planning? I understand from the March '86 Byte that the MMU will handle 4 megs. It seems reasonable to assume that the machine can easily be expanded to 2 megs by piggy-backing 256K DRAMS.

7) What is the status of the graphics co-processor chip? Is it going to be available for the 1040ST or for a future machine (100 Mhz, 1024 X 1024 pixel monitor, true 32-bit workstation)? Is or will this be user installable or even dealer installable? Does this give me an increase in number of colors on screen, blitter capability, etc.

8) Whatever happened to GEM Write? Is Atari still working with Digital Research? Or is GEM Desktop all we get? Anybody else have an "integrated" word-processing & graphics combination? Will Microsoft products ever be available for the ST? Like Windows?

9) If I have a 1040ST, is it possible to add an RF modulator (not that I would want to personally)? I understand there is a place on the motherboard for such a thing.

10) One last question: when will the new version of NEOChrome be finished? (At least version 1.0, right?) This is the version that fills in the missing boxes and adds animation capabilities like the infamous bouncing ball demo and the Cockatoo demo flying across the screen.

Don't mean to be so tedious, or to ask so many questions and I don't expect all answers from one source. The only reason I ask is because I am a dealer for the ST series and these are questions that I have been literally HAUNTED with for the past several weeks.

On the other side of things, I suppose that being bombarded with a

thousand questions on a machine shows a tremendous enthusiasm for the machine but it is awfully nice to feed the hungry savages once in a while and not just play the dumb dealer who hears nothin', sees nothin', and speaks nothin' about a new machine. Seems that most of the questions are centered around software.

I would appreciate any and all comments/suggestions/inquiries/editorials.

Hello,
     I have been working on a cross-compiler (VAX to 520st) and in
building the run time library have found many of the bugs with redirection.

There are several problems.

1) DO NOT USE Cconin/Cconout -- use Fread(0,buf,sizeof(buf))
There is a bug (as far as I can tell) in gemdos and the system bombs on redirection.

2) The read call works as follows.
a) if sizeof(buf) = 1 and the read call is to the keyboard the system will hang waiting for a character to be typed. There is no way to report an end of file. In the library I am writing I look for CNTL-Z.
b) if sizeof(buf) >1 and the read call is to the keyboard the system is doing (line at a time) input. What this means is that the Fread call inputs a line as though you were using the Cconrs system call. Note that line editing is invoked I.E. CNTL-H typed will scrub the last character entered. The returned value from Fread in this case is the COUNT of the characters in the line. This means that a blank line (typing a return) will give back a count of ZERO. soooo you must still look for a CNTL-Z from the keyboard.
c) if sizeof(buf) >1 and the read call is from a duplicated file handle -- using Fforce for instance. Then the system reads the file block at a time and a ZERO means EOF.

So, all you have to do is let your shell know which type of EOF trap to use depending on where the file is coming from. If it is truly from the keyboard ignore a ZERO and look for a special character CNTL-Z for instance. If input is from a FILE then look for ZERO instead.

Some other notes: The Cconin routines DO NOT work as advertised. Use Read instead. If you try to build an error channel you must do this.
also the micro c-shell uses the busted DRI C run time library. (I wish those guys would quit sending out toro-poo poo)
BTW will the sources for this shell be available?
Because of the problem mentioned above I have a great need.

This is my first posting. So go ahead flame me make my day

W.R.Wood

The only piece of software in the STarter Kit that produces two mushrooms
in normal use is the mushroom analyser. Reasons for mushrooms on other
programs might be

1. the program requires the machine to be in low resolution and your
   machine is in medium or high resolution.

2. the program requires the machine to be in medium or high resolution
   and your machine is in low resolution.

3. the program requires your machine to have TOS in RAM and you have TOS in ROM

4. the program requires your machine to have TOS in ROM and you have TOS in RAM

Actually I could continue the list but you get the idea - you have to experiment a little, putting the machine in different modes, before giving up on a piece of software.

Its my understanding, after reading all kinds of electronic and non-electronic info about the 520 and 1040ST, that:

- Initially, the 520ST had an analog RGB and non-standard hi-res B&W video out
- Future (and current) 520STs have a composite video out and an RF modulated video output.
- The 1040ST has only the analog RGB and non-standard B&W video out

I have also read one comment that seems to indicate that the 1040ST has composite video on some pin, but not brought out to a video jack.

QUESTIONS:

1) What resolution modes can be displayed through the composite video out?
2) What resolution modes can be displayed through the RF Modulated output?
3) Is there really composite video on some pin of some connector on the 1040ST?
4) Since I must have composite out for my application, what is the difference (besides cosmetic) between a 520ST upgraded to 1 Meg & 2 DS Drives versus a 1040ST with a DS external drive? Will they both run the hard disk?

Thanks muchly.

   Does anybody have any experience with third-party 3.5" double-sided
diskette drives? I'm most interested in the Shanner SD-2000 (advertised
in Antic magazine), which sells two for approximately the price of one
"official" drive. Any comments (good, bad, indifferent) would be
appreciated.
   I'd also be interested in any hard disk news-- has the disk driver
had the bugs shaken out of it yet, what do they cost, etc.

<Instead of responding to each single letter, I received...>

So far I got 25 responses from netters who are interested in Hack for
the Atari ST. A lot of them suggested to post an uuencoded binary to the
net. But I am not sure to do so because the binary with support files
is about 300kb in size, and compressed and uuencoded it will still be
around 200kb. But if there is more interest (let's say 100 netters) and
no one against it, I tend to post the binary. Otherwise I will distribute
it via diskettes.

If I decide to post: where should I do it? Could it be net.sources.games
or net.micro.atari16 or what else? And is there a maximum for article
size so that I have to split it into parts?

I do not intend to distribute the source since it is compiler dependent
(Lattice) and I used some include files from BSD.

Greetings,

Are you still keeping a library of public domain ST software and if so do you have PC HACK yet? I have it running on my ST (compiled under Lattice C) and am willing to distribute it. Since the game diskette is full and the sources use 2 more diskettes, I am not enthusiastic about sending it on USENET. Please reply if you are interested.

Keywords: PC Hack, Lattice C

I, too, have been able to get PC HACK to compile and run on the 520/1040 ST computers. As the .ttp file is 270K bytes, I am not enthusiastic about posting it to the net and am looking for alternate ways of

distributing it.

Until that is accomplished, here is one way to compile and link it. I used the Lattice C compiler on a 1 Meg system with one single sided drive.

To compile: create a 512K RAM disk and copy to it the following files:

* the compiler (lc.ttp, lc1.ttp, lc2.ttp)
* compiler header files (stdio.h, setjmp.h, osbind.h)
* PC HACK header files (*.h) in a folder (call it headers.fld)
* the source file (*.c), four at a time (compile four, copy the .bin files, remove both .c and .bin files, copy four more, etc)
* an editor (if needed)

I found that the sources used most of two disks. Furthermore, the .bin files used something more than 1 disk. Consequently, the strategy is to copy a .c file to the RAM disk, compile it, copy the .bin file to another disk, and erase the .c and .bin from the RAM disk. The command to the compiler I used is (leave off lc if invoking lc from the desktop):

```
lc -n -iheaders.fld\ <file>
```

Pack as many .bin files on a disk as possible. I found that all files alphabetically before u_init.bin fit on one disk. The total time to compile all files without having to edit to correct problems was around 2 hours.

To link: after you have generated two disks containing .bin files, you are ready to link. Create a file called hack.lnk containing the linker directives. It should be modelled after c.lnk, but expand the body to include all the .bin files you compiled above (instead of taking the command line). Here the strategy is to copy the first disk of .bin files (the one that is full) to the RAM disk and place the second disk on the drive, writting the .ttp file to the drive; thus, each .bin file on the second disk should be referenced in the .lnk file as b:name.bin. Resize the RAM disk to 435K (this is the smallest I could make it and still fit everything on it, leaving the rest of the RAM for the linker). Copy to the RAM disk the following:

* the linker (link.ttp)
* the libraries (clib.bin and startup.lib)
* the all the .bin files from the first disk
* the hack.lnk file

Run the linker with the following command line (leave off link if invoked from the desktop):

```
link -with hack -nolist -prog b:hack.ttp
```

After 15 minutes (if all has gone well), you should have an executable file on drive b.

WARNING: the source files will not compile (nor will the .ttp file run) without modifications. In particular, the files have to be adapted for the Lattice C compiler and for the Atari terminal emulator. Furthermore, there are problems with the compiler (e.g. the strncpy library routine has a problem, the compiler generates some code that can't handle certain pointer arithmetic properly, etc.). I will shortly post a list of problems I have discovered. If you start with the MS-DOS

version, be prepared to spend considerable time in just getting the
compiler and linker to work and then in debugging the code.

[A> <sigh>]

Hi,

An important question, this one. (quick answers appreciated)

Recently, I have picked up a copy of the PD CP/M emulator package (in
this case the `enhanced' package from Mikes Computer Store). In order
to work, the 3.5" disks must be formatted from TOS, then a program INIT
run from CP/M to make them usable. The problem is this:

a) The program INIT if run from drive A: as `INIT A:' will try to write
   to the utilities disk (bad idea I think)
b) I only have a single disk drive, and it does not prompt for swapping
   if I give it `INIT B:'
c) I have a few ramdisks, but none seem to be `INIT'able with eg.
   `INIT D:'

From the above, I am unable to init any disks, and can't even backup
the supplied utils disk. Therefore the emulator is useless.

Please help, What am I missing?

Any help appreciated.

Cheers,

In the PIANO shell archive we received from info-atari16 the
piano.uue file was damaged. There were lines longer than 61 characters
and two lines were garbage. Below you will find a listing of the
problematic part. I added the line numbers.

```
00001 begin 777 PIANO.PRG
00002 M8!H  %+"   -C   /J8                  "I/*FT !"/-  !@3B M  S0
00003 MK0 4T*T '-"\   % "( THW"O/____XN02\ +PU"9S\\ $I.0=_\    #"!Y
      .....
00490 M6@(  %H+  !:%   6AT  %HF  !:+P  6C@  %I   !:10  6DH  %I3  !:
00491 M7   6F4  %IN  !:=P  6H   %J)  !:D@  6IL  %JD  !:K0  6K8  %J_
00492 M  !:R   6M$   $  @ #  0 !0 &  4 "  !  @ "P $  T @ "!      #WE
      Note: line 492 is one character too long
      Lines 493 and 494 are garbage
      From line 495 (my linenumber, maybe higher or lower in reality)
      everything looks fine again
00495 M#  -  X #P"  ($ @0"! ((P $Q/040  %-!5D4  $-/4%D  %!,05D  $5$
00496 M250                              (  @ "  (            "
      .....
```

Could somebody please Email to me the correction for these lines,
or a complete piano.uue. The other files were OK.
Thanks in advance.

Organization: AT&T Information Systems Labs, Denver, Co
Lines: 86
Keywords: Lattice C, bugs, PC HACK

<is there still a line eater?>
As promised, here are the problems I have encounterd in compiling PC HACK with the Lattice C compiler, that I attribute to the Lattice package. Though I will mention them in the context of PC HACK, other Lattice C users may recognize the symptoms in things they have done.

1) max() is #define'd in a header file (#define max(a,b) (a<b ? b: a)). In one function, it was used as a formal parameter (function(..,max,..)). The compiler didn't like the formal parameter. Solution: change the name of the formal parameter.

2) one function declared 7 formal parameters, all with a register storage class. The second pass of the compiler died with a CXERR message and no indication of where. Solution: remove the register storage class specifier (I suspect that the compiler has an internal limit of 5 or 6 register storage class formal parameters).

3) the linker saw all symbols as upper case letters (e.g. monname() and Monname() were both seen as MONNAME by the linker, and it complained about a multiply defined symbol). Solution: change the name of one function in the source (be sure to also change all references to it).

4) some files would not link. The linker complained about an "error in relocatable file". In the process of breaking the unlinkable files into pieces, to find what was wrong, I discovered that each piece would link. One would think that the compiler was running out of memory; however, I could find no relationship between file size and ability to link. The largest file failed to link, but it also failed to link after it was broken into three pieces, with each piece being small to medium sized. Furthermore, the second largest file linked with no problems, but smaller files would not. Solution: modularize. Break your files into small units and be careful about how variables are shared between files.

5) some messages sent to the screen were incomplete. The strncpy library routine ALWAYS places a null character ('\0') at the end of the copied string. The standard UNIX(r) routine places a null at the end of a string only if one is found in the source string before the specified number of bytes is copied. Solution: write a different strncpy routine.

6) address error bombs when reading or writing "bones" files to or from the RAM disk (I lied. I don't think this is a Lattice problem, because I had the same problem when using GEMDOS disk read and write calls). The mushroom (cherry bomb?) analyzer told me the bad instruction was a

MOV.W (A0),(A1) and one of the registers was an odd address. The source code I had for a RAM disk had no MOV.W instructions (all MOV.B), so I couldn't identify the culprit. I tried the similar code in a small program and everything worked fine. I eventually figured out that the error occured when writing (reading) the second sector of a file when the first sector was several even number of byte writes (reads), a single byte write (read), then a large write (read) of several thousand bytes. Solution: be sure an even number of bytes are written (read) in each read or write call.

7) bus error bombs when writing or reading the "bones" files (those files gave me a lot of trouble). This one was traced to something the compiler is doing. Here is what the variable declaration looked like:

```
struct permonst mons[]={
     some initializations
}
struct permonst pm_ghost={ initialization};
```

Later, a pointer was set to &pm_ghost and &mons was subtracted from it, yielding the index of pm_ghost in the mons array (even though it wasn't in the array). The result should have been 0x39, but it was 0x60039. The linker map showed that pm_ghost was 0x39*sizeof(permonst) bytes away from mons[0]. Solution: fold pm_ghost and similar structures into the mons array of structures. I haven't looked at the code generated, but it appears the compiler is performing array bounds checking.

8) "record" files (containing the scores from previous games) gets garbage. This has been traced to the scanf() library routine, but it isn't consistent. Sometimes the scores will be read fine and later, one won't (even if it was read fine earlier). Solution: other than write my own scanf, I haven't found one.

Conclusions: as most software developers know, after you see the problem, the solution is frequently obvious. I found it very difficult to find some of these problems because I didn't write the source and because it is so large. So, I am posting these notes in hopes someone else will be spared some effort.

I have a question that I think might be related to this...

I am trying to do some things with the BIOS and XBIOS using an assembler.
Specifically, I am trying to monkey around with the screen resolution and
physical/logical screen addressing.

As far as I can tell, I am doing nothing wrong - yet the program results
in a double bomb and hangs the system. I have GEMDOS in ROM --- could the
above explanation be the culprit? (I'll try booting with GEMDOS in RAM
and see if I get the same error.) If this is the culprit, it bites the
big one...anyone know any way around it?

The answer to both is the same: both low and medium resolution will be
displayed through the composite, Rf, and RGB outputs. Unless you have a
wonderful TV set, picture quality of Rf in medium resolution is not too
great (TV's don't have enough bandwidth).

> 3) Is there really composite video on some pin of some connector on the 1040

Please do get more info on the "TT" Neil! If it's possible I'd like to know
when it may be available (late this year, early or late next year?) as I am
considering another system which will suport UNIX...

Also any other juicey facts (specs, flavour of UNIX (Sys V, BSD, etc)) would
be greatly appreciated!!

     I had exactly the same problem - mine was caused by bad

seating of the big square custom chips - the graphics chip and the mmu.
I've noticed that Atari is now using clips on these chips carriers. My
earlier machine had no chips. Try to be sure those chips are well seated
in their carriers.

Neil has spoken:
> The new thingamajig will be real fast, have its own memory, but
> will use a current-model ST for I/O, via the DMA port.
> Please don't ask me any more questions.
All right; I'll just flame a little bit.
1. Won't using the DMA port for graphics I/O conflict with, or at least
   slow to a crawl, hard disk I/O? Or will the box have its own SCSI port
   for a hard disk?
2. Atari seems to be targeting this thing for compute-intensive, but
   graphics and I/O -nonintensive applications. Do such applications
   really exist? I was under the impression that the attraction of 68000-
   based micros like the ST was their ability to manipulate graphics
   with ease; for other purposes, you may as well get an IBM clone.
   At any rate, I have an insatiable hunger for fast graphics, as my
   interests are mainly in affordable data analysis and CAD workstations.
   (And for that reason, I can't use the ST; its resolution in color mode
    is simply too poor. Atari is being left in the dust in that regard
    by the wave of 16-color, 350 line graphics that is taking over the
    IBM world.)

Has anyone managed to hook up a 1040 ST with a laser printer in any
way shape or form? Perhaps 1st Word printing in Epson mode through
the parallel port to one of the cheaper laser printers that take
Epson code? If so, please mail me any comments on your results and
experiences, and I'll summarize to the net.

Any news on the possibilty of an ATARI laser-printer (Neil?)?
If so, any ideas on how it would be connected, and what software
it might work with?

With regard to the question about Kermit being in the public domain,
the following lines are from the official Columbia University Kermit
distribution package:

> "Kermit is a voluntary effort. Although the Kermit protocol was
> designed by us at Columbia and many of the Kermit programs were
> written by us, the majority of programs were contributed from
> elsewhere..."
>
> "The software, sources, and documentation remain free. Kermit is
> distributed in this manner with the understanding that it will
> never be sold as a product per se. This is done in the hope that
> use of Kermit will become widespread enough to make communications
> between any two computers a real possibility rather than a pipedream."
>
> "Kermit is non-proprietary, thoroughly documented, and in wide use."

Does this help you any? If not, then I would say (in my opinion)
that the version of Kermit supplied with the developer's kit is very
close (if not identical) to the sample Kermit program supplied in the
back of the Kermit protocol manual (written in C). If this is the
case, then it _is_ in the public domain.

I've been reading ads for memory managers for PC's which let you load
and unload accessories from the desktop. Is there anything like that
for the ST, so that you can load *.ACC files as needed or get rid of
them if you need the memory? It seems one has to reboot to change
accessories, which is a pain, and a lot of people seem to be writing
useful programs as accessories instead of loadable programs.

I just posted a scientific calculator program on net.sources
It can be compiled either as a stand-alone program or as a desk
accessory (through a #define). Source is provided and the binary
for the desk accessory version. It still has some rough edges but
is useful enough for me to use it :-)

Hope you like it.

GEM-Kermit for ATARI ST

I'm posting the GEM-Kermit, an implementation of the kermit file-transfer protocol, which makes use of the GEM-capabilities to present a friendlier user-interface than "the other" kermit. Besides of that, GEM-Kermit can interact with IBM mainframes, a skill which the dev.-kit kermit lacks.

GEM-Kermit was implemented by Bernhard Nebel of Technical University Berlin, W-Germany. For comments, gripes, suggestions or complaints please contact HIM (nebel@db0tui11.bitnet). I'm only a poor irresponsible person, who posts GEM-Kermit to netland because Bernhard has no direct access to usenet.

GEM-Kermit comes in 6 Parts. The first two consist mainly of the uuencoded executables, the rest is source.
Part 2, the uuencoded GEM-Kermit, is the biggest (about 62K). I hope it will get through to all interested sites. I'm not sure whether 60K is one of the magic limits in netland. Let me know, if trouble arises.

I'll post the whole cludge to net.micro.at16. If somebody thinks it should also be posted to net.sources - let me know (why).

cheers, axel@coma.uucp

Does anyone know where I can obtain the C source to XLISP 1.6 (or later)
for the Atari ST?

As my only network connection is at 1200 baud across a 60 mile phone
call (rather expensive), it'd be really great if I could send someone
a floppy and return postage for the source.

Thanks for any help.

Hi,
     I have just uudecoded the fontloader program and associated
fonts. The font.acc installs o.k. and comes up when selected. After
I select a font, the systems looks like it reboots, and the desktop
comes up as normal. I have a 1040STf (i.e., TOS in ROM). Any info
would be appreciated.

Does anybody have the spec for the object file format (.o)
which is used by the developer's kit linker or have a guess
as to what I'll find there when I (hex) dump a .o file?
Is the Alcyon format significantly different from that used
by the linkers of other compilers?

thanx

In article <1984@dalcs.UUCP> silvert@dalcs.UUCP (Bill Silvert) writes:
>There is some confusion here about whether the kermit in the developer's
>kit is in the public domain. The manual seems to say it is (right on
>the title page), but we would like to make sure before passing it on to
>anyone else.

The following is quoted from the material distributed with the KERMIT
distribution from Columbia University:

------------------------------start of quote---------------------------------

Although KERMIT is free and available to anyone who requests it, it is not in
the "public domain". The protocol, the manuals, the Columbia implementations,
and many of the contributed implementations bear copyright notices dated 1981
or later, and include a legend like

  Copyright (C) 1985, Trustees of Columbia University in the City of New York.
  Permission is granted to any individual or institution to use, copy, or
  redistribute this software so long as it is not sold for profit, provided
  this copyright notice is retained.

The copyright notice is to protect KERMIT, Columbia University, and the
various contributors from having their work usurped by others and sold as a
product. In addition, the covering letter which we include with a KERMIT tape
states that KERMIT can be passed along to others; "we ask only that profit not
be your goal, credit be given where it is due, and that new material be sent
back to us so that we can maintain a definitive and comprehensive set of KERMIT
implementations".

------------------------------- end of quote --------------------------------

The document goes on to mention that you can do thing things like include
KERMIT support in a commercial package, but it doesn't seem like that
applies in this case.

In short, there should be no problem as long you don't make money on it.

>To avert any flames about the superiority of xmodem -- some of us work
>on Unix mainframes that support kermit but not xmodem, and would like to
>use SOMETHING for errorfree downloading from the net.

The major advantages to XMODEM are a)that it is more likely to be supported by a given system and b)that on any given file it tends to be faster than KERMIT. The increased speed is due to larger packet size (128 vs 94 bytes), less packet overhead, and the lack of character encoding (which is why an 8-bit data path is needed).

Actually, however, XMODEM is in many ways inferior to KERMIT, just more supported in the real world. In particular, XMODEM transfers require an 8-bit data path (no parity) and make no provision for sending batches of files. (The latter problem is addressed by XMODEM-based protocols such as MODEM7, TELELINK, YMODEM, and ZMODEM.) Further, KERMIT can be implemented on many machines (such as IBM mainframes) where KERMIT could never be implemented.

BTW, there are implementations of XMODEM available which do run under UNIX. Check net.sources and mod.sources for programs named UMODEM and rz/sz (or rb/sb).

Anybody know if it's possible to upgrade the ST's 68000 to a 68010 or 68020?

-Matt

After owning an ST since last August, I have come to the conclusion
that it is time to clean the disk heads (my most-used drive is
becoming unreliable). Does anyone out there have any recommendations
on cleaning kits or techniques? When I owned my 5 1/4" drive computer
I used the Verbatim cleaning kit. I realized that it may be abrasive,
but it doesn't make any difference if I only clean the heads every 6
months anyway. I have an aversion to the cotton swab and alcohol
technique due to the fact due to the fact that I once caused a lot
of trouble with my pressure pad (in a 5 1/4" drive). I'm open
to any suggestions. If I find a good answer I'll post it to the net.

Thanks,
R.T. Bradstrum

Is there anyone on BITNET who has the earlier releases of the file
called ProGEM ?? If you have them, and are willing to send them to me,
leave me mail at CS112170@YUSOL.bitnet

Note, if there's anyone through the gateways that's willing to do it,
please send mal as well.
          (^^-- mail)

Thanks in advance.

>
>I origionally bought my 520st cause I was told AT&T was porting UNIX to it.

Wasn't this discussed to death months ago? Didn't it turn out that what
actually happened is that AT&T announced they were looking at using the
520 as a *terminal* for a Unix system and the news got rather distorted?

I doubt you will ever see a working, reliable Unix for the *current* offerings
from either Atari or Commodore. The disadvantages of running Unix as a
general purpose OS without memory protection are just too great. Though of
course an ST running a Unix derived kernel and fully debugged, well-behaved
"canned" applications is certainly doable, the question is, is it worth
it?

I think the reason for the RCS not outputting pixel coordinates is that
resource files should be usable with different resolutions. This is also
stated somewhere in the GEM manual, as far as I know. But I have to
admit that the RCS is a real hassle to deal with. Did you ever try
to incorporate multiple icons in your resource file using RCS ? It screws up
the resource file completeley, and you have to remove the complete
object tree which contains these icons.

The next 2 entries consist of a readme, startup file for u-emacs
and finally u-emacs for the ST (uuencoded)

This version was compiled using Lattice C.

Is Hightstown nearby? It is in Ma Bell area code 609.

Anyway, CSC, Inc. in Hightstown *** M A Y *** sell 1040s. They definitely do
have some other Atari products like the Model 850 communications interface for
the 800 series.

Their phone number is (609) 448-8889. I have dealt with them by mail order
and found them to give excellent service.

>
> We have a 520ST but can't get it to quite work with vi under vt52.

I use my ST all the time, but... The ST has MORE capability
than the basic VT-52, but there is only ONE critical difference.
Copy the VT52 termcap entry, rename it to atarist or something,
and change the entry li:24 to li:25. Then everything works fine.
The ST has 25 lines and not 24. This messes up scrolling at the bottom
(the editor moves the cursor to the bottom line, then issues linefeeds
to scroll the screen up. If it thinks the bottom line is 24, linefeeds
will simply move to line 25 on the ST and not do the expected scrolling.)
There have been plenty of other postings of ST termcap entries, but
I thought maybe an explanation of just what the problem is would help
in case you don't get the exact detail now, you can reconstruct the problem
later.

By the way, we are experimenting with STs here as terminal
replacements. We will either develop custom window software, or
adapt the ST to work with X windows. The ST in 40 or 50 line mode
has the potential for a GREAT multi-window terminal for Unix. We
will post the code when it is done, or would like to hear from anyone
who is doing something similar to avoid duplicate work.

I have heard of a possible special deal on 520ST systems - full color
systems with RGB monitor and disk drives for $599.00. The only catches are
(1) the deal is not certain at this time and (2) the units will be technically
used units, because they were bought by a major customer who subsequently
decided not to keep them. If anybody is interested in signing up or inquiring
about this possibility, they can do so by logging into the BBS at Nite-Lite
Systems, (617) 663-4221 and leaving a message indicating their interest.
To maximize the chances of the deal's going through, it would be useful to
indicate how sure you are that you will want a system at that price.

I have no financial interest in Nite-Lite Systems, other than being a
potential customer if this deal goes through.

1) Did anybody try out Robinsons LISP/ST ?
   (Seen in June Issue of Atari User, Vol.2,No.2)
   It costs 90 UK pounds, or 100 with a GEM interface.
   Is it really COMMON LISP (it claims so) ?
   Does it have an Editor (emacs-like) with a Lisp interface (no information
   about that) ?

2) Does anybody know of a Scheme implementation for the ST, possibly with
   a flavor package (like the TI PCS) ?

Thanks for your replies !

Speaking of Unix* windows for the ST, hasn't anybody out there done a port
of the Macintosh uw program to the ST. The sources for both the Mac and the
Unix end are public domain (I expect you could get them out of net.sources.mac,
I have them). For those who aren't familiar with uw, it handles a number of
windows, each of which is a sub-shell of a login to a Unix system. It's really
great!   Anybody done the port, or working on it??

*Unix -- it's somebody's trademark and all that nonsense.

> it was prophetic that the last issue had a black cover?

No. Actually the magazine was doing quite well. The only problem we had
was staff -- we are trying to do an awful lot with few people, so the folks
involved in the magazine kept getting pulled into other tasks, to the
detriment of the magazine's schedule.

Solution: we hired David Ahl and Betsy Staples, both formerly of Creative
Computing, and let them set up shop back in Morris Plains, NJ. We have
given them enough corporate backing to put together a real staff whose sole
duty is the magazine. The Explorer will continue to be Atari's voice, and
will be stonger due to more attention devoted to it.

Look for the first issue under Ah/ & Staples in July, and bimonthly for the
next while. 1987 -- monthly, if ahl goes well.

It works fine on my machine. I just put it on the Atari BBS, so hopefully
it will be disseminated soon.

TOS Error #35 is "Too many files open" (no more handles left). Either you
glitched the copy of the program, or a prior application wasn't closing
things properly.

A real book version of the documentation will appear this Fall at book
stores. We'll let you know when things get close.

Looking at the circuit diagram, i can confidently state that the GPO pin is
attached to pin 15 of U19. U19 is apparently a YM2149, but that may not be
a manufacturers part number. U19 appears to have 2 parallel ports, 3 analog
pins and a bus interface. Serial port B is connected direct to the printer
(centronics) socket on the back of the keyboard unit. Port A supports GPO,
RTS & DTR on the Serial socket, and has 3 lines going to the Floppy disk
port for drive 0/1 select and side select. The 3 analog pins are attached
to the audio in/out pins on the monitor socket. The bus interface goes to
2 6850 ACIA's and a 68901.

There doesn't appear to be composite video, but then hasn't there been some
discussion here recently about retro-fitting 1040's with modulator, etc.
Maybe composite video appears there.

The above information is probably copyright Atari Corp., but I think it's
sufficiently vague that it doesn't disclose any company secrets. Besides,
you could probably get the circuit diagrams direct from Atari anyway...
My copies of the diagrams came with the Dev. Kit.

   It amazes me what people have to pay money for! These "products", and
many I've noticed like them, are not so much products as relatively simple
utilities. Such utilities should be (and are, to a large extent) available
free on any BB worth its salt. I mean, can you believe somebody is actually
selling 'make'?! Luckily, we have kind and generous people like Mssrs.
Franco and Fish (for the Am*ga), who selflessly give of their time and

machine use so the rest of us will benefit from PD software.
   Anyway, my first project is writing a ramdisk utility like the above, but with the added feature of automatically copying specified files to the ramdisk (they'll be listed in the config file along with the size). This will be public domain, especially as it is based on Mike's Ramdisk. So if you're willing to wait awhile (my C compiler is due Any Day Now), you won't have to buy one. Also, I'll look into the screen dimming, just to be perverse. (Would one "merely" have a short program monitoring the mouse and keyboard, which would twiddle with the color values after a certain amount of time, and then reset them at the next keyboard/mouse activity? I know how that kind of thing is done on the 8-bit line...)

   On another topic... perhaps that monitor with the built-in disk drive actually functions as a bulk diskette eraser (:-). Actually the IBM PC I`m using right now has two floppy drives immediately under the extremely static-y (staticky?) monitor, and I don't have any problems with it-- and if IBM can do it, *surely* Atari can! (:-)

I had a bit of trouble getting 'cadenza' (the checkers program) to run but finally solved the problem. It seems that by time I got the cadenza.uue file to my machine all of the trailing blanks had been striped off. These are important to the version of uudecode I have. The file should have the first line with 'begin' the mode and the filename fillowed by a newline only. The last line should contain 'end' followed by the newline. All of the other lines should be blank filled to the same length. (Strictly speaking the last couple of lines are shorter, but that is unimportant.) So to get the program to run you should either blank fill the lines using an editor or fix your uudecode

to supplyu| the trailing blanks as required. Anyhow have fun, it seems
to work just fine now. /bill {the blank eater strikes again ...}

The best editor Ive found is the GST editor (available seperately or with any
GST products). It is a full GEM based editor that can edit up to 4 file, and
even cut and paste between them. It alows long line (>80, I think about150).

It has a help menu available and very good PRINTED (ie not disk file)
instructions.

The only complaint I have about it (does any GST employee monitor the net)
is that there is no GOTO line number in it.

Subject: Megamax C
Newsgroups: net.micro.atari16
Distribution: net

I recently received Megamax C and my first impressions are very favorable.

Having *suffered* with trying to deal with an Apple Mac Plus and both DeSmet C and Aztec C ...i appreciate what Megamax has done on the Atari. Of course some of the problems with the Mac Plus are non-existent on the Atari. For starters, the ST has had a hierarchical file structure from the very beginning...(Apple's recent introduction of their HFS is surprising in its lateness and is causing problems with existing software packages that depend on their original flat file structure).

In any case...on to the good stuff...

The Megamax development package comes with two single sided diskettes and a thick binder with the documentation. The layout of this binder is :

1: The Atari ST Environment
2: Language Extensions
3: The Linker
4: Megamax Shell
5: Megamax Editor
6: Megamax Resource Construction Program
7: Librarian
8: Disassembler
9: Code Improver
10: Unix Compatible Routines
11: GEM AES Routines
12: GEM VDI Routines

13: Bios Routines
14: Xbios Routines
15: GEM DOS
16: System Globals
17: Error Codes
Appendix A: Header Files
Appendix B: System Limits and Extensions
Appendix C: Keyboard Codes
Index

(Yes - shockingly an *index*. Anyone that has had anything to do with both the Manx Aztec compiler documentation for both the PC and the Mac may faint...)

The diskettes included contain:
-compiler
-system library
-graphical shell
-desk accessory library
-linker
-editor
-header files
-double precision library
-examples
-code improver
-resource construction program
-disassembler
-librarian
-megaroids (a game written in Megamax C)

A note : a make facility is included.

Apparently for $50 one can also get the source code listings of system library functions. (these are not included in the Megamax development package).

Updates will cost $20.

The Megamax C package is capable of being used off the:
1) GEM Desktop
2) Beckmeyer Micro C Shell (unix-like shell) or COMMAND.TOS
(I haven't tested this out)
3) Megamax Graphical Shell

Graphical Shell:
So far not only have i found the Megamax graphical shell(gs) tolerable but also likeable. Tho' my preference i suspect will eventually be the Micro C shell. So far i have found the gs pretty good.

Editor:
The editor that is supplied is from acceptable to good. I *really* disliked the editor supplied with the Atari/DRI development package. The megamax editor is quirky on two points: find and the arrow

keys - if these are editor quirks and not my own doing.

Resource Construction Program:
Is similar but not identical to the DRI RCS.
The DRI RCS has some trash can and clipboard icons not found in the Megamax version. The Megamax RCP instead uses a pull down menu to accomplish these functions. I didn't use those icons for much but some people may miss them. Megamax improved significantly over RCS by including an icon design tool. Additionally they include an options menu that has a sort (sorts the tree structure of the immediate children of the selected object).

Librarian:
I have not got around to looking at this.

Disassembler:
ditto.

Code Improver:
ditto.
The code improver "performs simple branch optimizationss on an object file that has never been in a library.

Unix compatible routines:
abs,atof,close,toupper,tolower,_toupper,_tolower,toascii,creat,isalpha,
isupper,islower,isdigit,isalnum,isspace,ispunct,isprint,iscntrl,isascii,
exit,_exit,fclose,fflush,ferror,feof,clearerr,fileno,fopen,freopen,fread,
fwrite,fseek,rewind,ftell,getc,getchar,fgetc,getw,gets,fgets,lseek,malloc,
free,calloc,open,printf,fprintf,sprintf,putc,putchar,fputc,putw,puts,
fputs,rand,srand,read,sbrk,scanf,fscanf,sscanf,setbuf,setjmp,longjmp,
strcat,strncat,strcmp,strncmp,strcpy,strncpy,strlen,strtol,atal,atoi,ungetc,
unlink,write

footnote: i asked megamax if a system() function existed...they pointed to execv(name,argv) --- (char *name; char *argv[]) as existing but being undocumented...i tried this and couldn't find it...

AES,VDI,etc:
I haven't had time to examine AES, VDI, Bios and Xbios functions but a cursory glance tells me I don't seem to be missing anything that I have in the DRI/Atari development package. I have ported a couple of things that seem to work nicely. The port times were pretty good.

Another nice feature in the documentation is a listing of all the system globals, errors, header files.

C compiler:
I had program (written with DRI C) that put up a menu bar and window it ported in 10 or 15 minutes. Of that time 95% of the time was spent in the editor. The main problem stemmed from using some of the unportable #defines from DRI's <portab.h> - BYTE, LONG, WORD.. Megamax C complained...about the DRI RCS generated C code using these keywords...i changed these to the more portable char, long,int and all was well...The compiler is pretty fast (tho' i

have a one megabyte ST which helps :)

*compiler is a one pass compiler.

*space used by a program at run time is divided into a number of segments.
Each segment may contain up to 32KB.

*8KB stack space. changeable by modifing the init.c file in the system
library.

*linkable object code is generated directly. no assembly post-pass.

*overlay mechanism

*inline assembly code

Linker:
*smart linker - loads only what is need.
*gives stats

CONCLUSION
The overall package is a streamlined well documented one (includes explanations
a la unix man pages of all unix,aes,vdi,bios,xbios functions). In my mind
it accomplishes in considerably less paper what the messy Manx Aztec C
documentation can not do in hundreds of pages.

This mini-review is should in no way be taken to be a comprehensive
examination of the product. These are just my observations.

My current feeling about the package is very positive. It seems to be
the environment I was hoping to find. The fact that i can use it in
a number of environments (Micro-C shell,Command.tos,GEM desktop, megamax
graphical shell) provides an even more flexible package.

Here is a reference card for the microemacs editor that comes with the ST developer's kit. It could be useful to someone like me who is experienced at using screen editors but has not used emacs. You should be able to figure out how to use microemacs just from this card (until you get used to using it, you can put the card in a one line window at the top of your screen and use it as a quick reference). Anyway, it should be preferable to the tutorial that comes on the disk, which is unbelievably verbose.

---cut here---

MicroEmacs Command Card

Movement Commands

^A	to start of line	^E	to end of line
<esc><	to start of buffer	<esc>>	to end of buffer
^F	forward a char	^B	back a char
<esc>F	forward a word	<esc>B	back a word
^N	forward a line	^P	back a line
^V	forward a screen	<esc>V	back a screen
^S	search forward	^R	search backward

Edit Commands

^D delete next char (with argument: kill next argument chars)
<del> delete previous char (with argument: kill previous argument chars)
<esc>D kill next word <esc><Del> kill previous word
^K kill to end of line or kill newline if at end of line
(with argument 0: kill from start of line to current char
with positive argument: kill next argument line
with negative argument: kill previous argument lines)
^@ set mark ^W kill from mark to current char
^Y insert copy of kill buffer and set current char to end of this text
<esc>L make next word lowercase <esc>U make next word uppercase
<esc>C capitalize next word
^T transpose current and previous chars

Buffer Commands

^X^V create new buffer containing file and display it in current window
^XB change buffer displayed in current window
^XK delete buffer
^X^R read file into current buffer ^X^W write current buffer to file
^X^F change current buffer's associated file
^X^S save current buffer on its associated file
^Z save current buffer and exit ^X^C exit without saving buffer

Window Commands

^X1 delete all but current window and expand current window to fill screen
^X2 split current window into two; usually followed by ^XB or ^X^V

```
^X^B    create window showing information on all buffers
^XN     to next window                  ^XP     to previous window
^XZ     enlarge current window          ^X^Z    shrink current window
^X^N    scroll current window forward   ^X^P    scroll current window backward
<esc>!  move current line to top of current window
        (with argument 0: move it to center
        with positive argument: move it to argument lines from top
        with negative argument: move it to argument lines from bottom)

Other Commands
^U      specify argument to other commands
^C      escape to MS-DOS                ^G      abort a command
^X(     begin macro definition          ^X)     end macro definition
^XE     execute macro                   ^L      redraw screen

I've just started using the Megamax C compiler.  From what little I've
used it so far, I think I'm going to like it a lot.

I was wondering if any other users had encountered any bugs or other
"gotchas" that it'd be useful to know about?  You know, the kind that
have you beating your head against the wall until you finally figure
out what in the heck is going on.

I've found one of these regarding makefiles.  I followed the example on
page 4-3, and tried running it from their shell.  I kept getting an
"I can't find that file" error.  I figured I was doing something wrong,
but I finally figured out that their example is wrong.  If your makefile
ends with a link command (optional), the link command has to be
"mmlink.ttp ...", NOT "mmlink ..." as stated in the manual.

I also fully agree with the earlier posting about cursor movement in their
editor.  I think it's crazy to have to reach for the mouse to move the cursor up
one line!  (ALL cursor movement requires the mouse.  The cursor keys
scroll the WINDOW, leaving the cursor in the same place!)
```

Anyone else have experiences to relate?

Summary: Continuation of OS-9 68K

Due to a mixup in management, the OS-9 68K Special Conference on the Byte Information EXchange was mistakenly re-announced for June '86. Well, Byte management, not being the type to allow disappointment has extended the accounts for all the Guest Experts through to the end of June '86. Although we have no commitment from them to maintain their presence on BIX, we have taken steps to notify them of the extensions and hope that they will have the time to participate.

In particular, Kim Kempf has told me he intends to check in daily on BIX, Peter Dibble has been active lately, as has Frank Hogg, and Peter Gallanis has checked in for messages. I hope to see Brian Lantz back on and Peter Beaven as well. Discussion, for now will take place mainly in the regular 'os.9' conference and will likely be wider ranging than the original 68K Special Conference.

As before, we welcome all relevant discussion.

Cheers! -- Jim O.

ditzel@ucbvax.berkeley.edu (Charles L Ditzel) writes:

>I recently received Megamax C and my first impressions are very favorable.

I found this review to be generally useful and informative. I may indeed acquire this system for my work, if it's as good as it looks. Below are various comments, questions, gripes and flames.

>Editor:
>The editor that is supplied is from acceptable to good. I *really*
>disliked the editor supplied with the Atari/DRI development package.
>The megamax editor is quirky on two points: find and the arrow
>keys - if these are editor quirks and not my own doing.

On the basis of what features do you reccomend the megamax editor over micro-emacs (I assume this is what you mean by the atari/DRI editor)? Why did you dislike micro-emacs? A statement like the above is next to useless.

>Unix compatible routines:

>abs,atof,close,toupper,tolower,_toupper,_tolower,toascii,creat,isalpha,
>isupper,islower,isdigit,isalnum,isspace,ispunct,isprint,iscntrl,isascii,

>strcat,strncat,strcmp,strncmp,strcpy,strncpy,strlen,strtol,atal,atoi,ungetc,
>unlink,write

But not fork(), wait(), getenv(), setenv()? Sounds like about par for the microcomputer C course (which is not /so/ bad).

You're joking, right? The whole idea behind DRI's "mandatory coding conventions" ;=| is that you make one silly <portab.h> file for each compiler/system/whatever, and *leave the .c files alone*. Thus

```
#define BYTE  char
```

once and for all.

<flame on>

Whether this is all worth anything is another story. In particular, it seems that their LONG declaration is often better served by (void *) (which may even become standard if people take a liking to implementing standards --- ANSI has put massive amounts of work into this type of stuff --- unsigned char's and the lot.) Seeing LONG used to mean (type *), like in the gem manual makes me somewhat ill. C supports high level distinctions like "A long is not necessarily a pointer and vice-versa". Why shoot yourself in the foot with such a neanderthal convention?

My developer's package came with two versions of APSKEL.C --- atari's and DRI's. The main differences were:

1) DRI's worked --- it redrew the window at the right time.
   Atari's was somewhat fractured when it came to updating.
2) Atari's had comments like (I quote from memory)

```
/* #include this to insure incompatability with all known systems
*/
```

or somesuch at the top of portab.h, and
/* Storage wasted for idiotic bindings
*/
after the declarations for intin[] and company.

While I agree with atari's sentiments, I find it disturbing that they managed to introduce bugs into a working program. Also, one (or both) of the versions had constructs like

```
wind_update(TRUE);
```

where you just have to know that TRUE means 1 (fortunately this is the non-zero value that everyone picks) and that 1 means either begin update or end update (fortunately context makes this clear, /if/ the code is correct). You tell me why they didn't just #include the proper file and be done with it. A magic number is marginally more legible than a meaningless manifest. (By the way, wind_update has /four/ meaningful input values, not two, as suggested by the use of TRUE), but a well chosen #define beats the shit out of both.

Moral: The preprocessor is /your friend/, if you let it be. But (alas) it seems that no one wants to take the trouble to use it responsibly. (I will now duck as legions of responsible programmers pelt me with rocks and garbage. Of course /my/ code is always flawlessly perfect.)

<flame off>

>*space used by a program at run time is divided into a number of segments.
>Each segment may contain up to 32KB.

Is this a bug or a feature? As a survivor of the /wonderful/ world of the 80x86, I would tend to think bug. Does this actually mean something more humane and useful? Is there any way to get a huge array (>64K)?

Thanks again for the review.

Thanks for the response Eric...

The premise I was under was munged up. I kept thinking that some routine
was bombing my code. Indeed it 'twas I that was screwing up some system
routine by incrementing the interrupted code's D7. As soon as I stopped
incrementing D7 everything went hunky dori.

However......
A new question..... why do I get spurious interrupt traps 40-50% of the
time or more when I crank that timer up? To see what I mean use a prescaler
of 4 and a data value of 14 or less. Indeed, at times the machine goes to
sleep period. Other times as I've mentioned you'll be staring at 24
bombs.

Correct me if I'm wrong, the MFP interrupts at CPU level 6. Further, since
we use the MFP's software end of interrupt mode, no new level 6 interrupt
can interrupt or pass it's vector during my interrupt routine. Not even the
level 14 and 15 MFP interrupts. Since their are no level 7 (NMI) interrupts
that I'm aware of (are there?) what could be causing the spurious
interrupts? Even if their were another level 6 source (I believe the
MFP is the only one) it should be blocked because the CPU is already at
level 6. Right? The timer is clocked at 2.457 (or something like that) mhz
so I don't *THINK* it's timing out before my code (being run at 8mhz) is
completed. And again even if it were it won't be noticed until I clear the
In Service Register right? Is there a limitation of the MFP I don't know
of? For example you can't generate another interrupt with xxxus of the
previous because the vector register junk can't setup in time. Or something
like that? If so I missed it in the Motorola MFP manual.

Any ideas?   Anyone???

Now this is the type of stuff we should be discussing. I love it...

PS. Has anyone noticed that the current ST could NOT use a 68020? The $##%$#$! OS writer's used the upper byte of the exeception vectors for data! Just like Motorola said not to! Wonderful aye? Of course their are other things that would need changing as well. Guess they never intended to extend the ST/TOS system beyond the current ST's. Then again considering GEMDOS.... it might be just as well. 8-)

PPS. Does anyone know if GEMDOS is reentrant. I've heard that it is NOT and I've heard it is to 4 levels. Anyone know fur sure? Neil? What kinda hacking would it take to make fully reentrant? How 'bout the XBIOS and BIOS code? Is it fully reentrant?

Hello,

Could someone tell me how to use the GEMDOS routines 'Dup' ($45) and 'Fforce' ($46). The documentation I have (First Publishing book, 'Atari ST Internals') doesn't explain how to use these routines.

Many thanks,

Andrew B Smith.

You know Neil, I could have sworn that when I bought my ST back in October
of last year I sent in the subsciption card to AE with either the bill me
or credit card fields ('fields' ... must but a 'puter nut!) filled in.
Never did get a single issue. Course I don't remember getting billed
either. Oh well, how can I tell if my subcription was never filled or if
there was no magazine to fill it with and will get one when it becomes
available?

  Don't have the books handy, but there are some routines to do this.
The 'gemlib' startup code with the dev kit pulls things off the command
line and puts it into the char *argv[] array like a UNIX system would,
but it ALWAYS puts the string 'C Runtime' into *argv[0]. This is a
pain, so the AES has a routine called SHEL_READ which allows you to pull
stuff off the 'command line' or wherever the command came from, and I
think they DO have the ability to get at the command name. There is
also a SHEL_WRITE which allows you to generate a new 'command line' for

Pexec()'ing another process, plus a couple of other routines. Check the
Abacus GEM Reference Manual. Now if you could make multiple links to
the same executable, you'd be in business!

Main thing is to use a slow shutter speed, no faster
than 1/32. This is especially important with a focal-plane
shutter. Slow film is fine because you can open your lens
all the way up, since no depth of field is needed.

El cheapo camers have slow blade shutters, so should work well
if you use fast film. Parallax thru the viewfinder will
require some guesswork on anything other than an SLR.

If your camera has thru-the-lens light metering, use it and
believe it, provided you move in close enuf to fill the entire
viewfinder with the screen. And of course, darken the room
as best you can.

I've had good luck with color and amber CRTs myself.

I knew some people once who were implementing a UNIX(R) library for a Mac
C compiler. One of them wanted to provide fork() like this:

```
fork() {
     errno = EAGAIN;
     return -1;
}
```

This should also work for the ST... :-)

>   University of Dortmund

I found the following when trying to make a dialogue box with the Resource Construction Set. The dialog box included both text and an image (bitblk). Sometimes it worked, sometimes three boms appeared when trying to open the dialog box (that happened both in the RCS and in the apllication using the resource). It turned out that the problem is the generation of the .RSC file by the RCS. First the resource header (as defined in one of the header files) is generated. Then all the strings used in menu's, TEDINFO's, alertboxes, etc. After that follow the bit images of the images and the icons.

These images have to start on a word boundary ||||||||||||

When the total number of bytes in all the strings (including the ending nulls) is odd you will have a problem.

The remedy is simple. Construct your resource. Save it. Load it again. Try to open something with an image or icon in it. If boms occur, change one of the strings (doesn't matter which one) by adding or deleting one character (a space probably). And, magic, it works.

I foun out about two weeks after sending this message about the new TDI
modula-2. But at a 25 pound (UK) update fee, that in effect ups the cost
of the compiler by 25%. If it wasnt for people like me buying these
languages (and the ST) when it first came out (and often waiting months
for delivery) then some of these companies would go bankrupt before
getting out the PROPER version.

METACOMCO charge a slightly better 10 pound update fee - but they dont
supply the acc object file or a resource editor. I have managed to
get copies of these that I can use with most languages - but no doubt
as soon as I pay for an update TDI will bring out yet another better
version and screw me for another 25 pounds if i want it.

SOME REPUTABLE COMPANIES (on other machines) PROVIDE FREE UPGRADES IF
YOU SEND IN THE ORIGANAL DISK (this doesnt stop you using a backup
while you wait for delivery.

Please, all the companies with more money than me - GIVE ME A CHANCE.
I am trying to keep up to date - when i can afford it.

Thanks to Neil and Bill (Pase@DOCKMASTER.ARPA) for answering my query. I
think the problem is probably lack of trailing blanks.

BTW, Neil, I get TOS Error #35 even if I re-boot the system, open 1 window
and then run cadenza. "Too many files open" ?? You sure 'bout that ?? :-)

This is a mild complaint aimed at Atari - I hope I can get
a response out of Neil...(how 'bout it, Neil? ;-))

We purchased our ST back in January. My understanding was that
when I sent in the warrenty card, I would receive ST BASIC in the
mail along with a manual. Well, gosh, here it is June, and I haven't
heard word one from Atari. If I didn't buy a PASCAL and an Assembler,
I'd have been stuck with a $800 Logo-only machine. (*shudder*)

How's'bout sending me my property gang?! ;-)

Incidently, here is a seperate question also for the gang at Atari:

Neil ---
   What was the story behind the policy decision to make people who
already have Atari ST's purchase seperately the GEMDOS in ROM chips?
Since you are now providing them bundled with the ST at the same price,
don't you think it would have been "polite" to send out TOS chips to
all of us that bought the ST when it was still a "risky, new machine"?

Just curious....

Just got back from Summer CES in Chicago and thought I'd share
what I saw and heard there.

Atari

Atari was there in force with a really big exhibit. As you walked
into the Atari area there was a Video digitizer on the left
and an audio digitizer on the right (both hooked up to 520 STs).
The Video digitizer was made by Hippo. It plugs into the ROM slot
and uses a standard video camera (b&w). The pictures are taken
every 8 seconds and can be stored in a NEOCHROME format. You can
later use NEOCHROME to modify the captured imaged. It retailed for
around $150 and can be used with either the mono or color 520ST.
I forget the name of the company that was demonstrating the audio
digitizer. A lot of third party developers were there showing off
their latest and greatest programs. Faster Than Light (makers
of SUNDOG) were showing a beta version of DUNGEONMASTER. A D&D
type game where you actually see the inside of the cave as you
walk along (imagine WIZARDRY made with really fantastic graphics).
EPYX was showing ROGUE, the ST version has some really nice features.
Firebird (makers of PAWN) were showing STARGLIDER, my favorite
in the show, kind of like the arcade version of STAR WARS. Blue Moon
software was demonstrating a SIDEKICK-like GEM utility.
HIPPO had a 520ST hooked up to a HP laser printer demonstrating
HIPPOWORD. I asked several vendors about support for the new
24 pin printers, and most of the new packages will support
the LQ800 and others. A lot of the displays were so crowded
I couldn't see all the software being shown. There were also
demos of Battlezone and Joust, but no Star Raiders. (I have heard
that Star Raiders is being sold in Europe, any comments out
there???) Batteries Included was advertizing PAPERCLIP ELITE
but was not actually showing it. ABUCAS had their own booth
and was showing the Circuit Board Design program and a 3D
graphics program. They are coming out with 6 new programs this
year but I can't remember what they are. Atari was not showing
of any new hardware, so I didn't get to see the new MS-DOS box.

Commadore

Commadore had a really small booth in a really obscure corner.
They were not even showing the AMIGA but were pushing a new
C-64. This gives fuel to the rumor that they are dropping the
Amiga. I asked about the Amiga and was told that the Amiga

was shown at the last show so they were showing the 64 and
128 only at the CES so all Commadore machines would get
equal exposure.(???????????) Oh well, I better not go on or
I will be accused of being a doomsayer.

Have recently purchased the TDI Pascal, and have discovered it is a true
UCSD Pascal, complete with its own OS. Zero compatability with GEM, so...
Has anyone got a utility to convert GEM files to something readable by the
system? Have all my source on 5 1/4 floppies, and would like to be able to
port it over to the ST. TDI Pascal does come with Remtalk.code (undocumented)
but don't need the hassle of enlisting friends (with computers) to connect up
every time I need to transfer some source.

If no utilities around, any offers on a 'used only once on a rainy Sunday' set
of Pascal disks with manual? (Comes complete with low opinion of 'enhanced to
improve file access' feature).

Taylor Jackson
Above are my opinions, hopefully everyone else's, too.

Summary: Some tips

In article <726@mprvaxa.UUCP> jackson@mprvaxa.UUCP (Taylor Jackson) writes:
>Can anyone out in netland give me pointers, hints on how to photograph
>color monitor displays?

There was a real nice article on how to do this about four years ago.

In short, it is reccomended that you use an SLR camera, mounted on
a tripod. Darken the room as much as possible. Set the shutter
speed for at least 1/2 second, preferably longer, and set your f
stop way down, say to f22, use a light meter to get the best setting.
If there is any "overscan" such as is found on ntsc monitors, the scan
lines will disappear. An ST screen (mono) has just a little "crawl",
so your final picture will not look like a screen, but like a white
piece of paper. Diagonal lines will still have a slight "stair case"
look as always, but vertical lines and most text will appear quite
solid.

Good luck.

Does anyone have a PROFF printer driver for a NEC8023 ?

The problem is that bold and underline don't work properly on the NEC

because of the way it stores and prints lines. It is effectively
ignoring backspaces... :-) You tend to get bold text lliikkee tthhiiss or
for underlined text l_i_k_e t_h_i_s_ !!

Summary: more observations

In article <564@ssc-bee.UUCP>, ditzel@ssc-bee.UUCP (Charles L Ditzel) writes:
>
> I recently received Megamax C and my first impressions are very favorable.
>

I too recently purchased Megamax C. I really like the package and agree
with what Charles wrote about it. I do have a couple of observations that
I would like to share.

1) I/O redirection does not work correctly with Megamax C. I first heard
about this on Compuserve, and I have since tried it for myself. I tried
redirecting output from a program supplied with the Mirco C shell into
a program compiled with Megamax. The Megamax program is supposed to filter
the standard input and print some results on stdout. The Megamax program
doubled the input lines and inserted garbage characters before sending
output to stdout. If stdin was not redirected in the shell, then the program
worked correctly.

I also tried redirecting stdout and the program crashed! Obviously this is a bug in the libraries that needs to be fixed. Especially since the documentation states explicitly that i/o redirection should work correctly.

I must add, however, that this is the only major bug that I have heard about, or experienced. Everything else seems to work as advertised.

2) The icon editing feature of the RCS supplied with Megamax is good, but I wish you could save/load icons to/from the disk. This would be a timesaver when using a set of "standard" icons in an application.

3) My overall impression of the package is very favorable. The documentation is fairly comprehensive and mercifully concise.

Developing programs with this package is much more pleasureable than with the developer's kit. I have a one meg 520ST with a half-meg ramdisk. I can fit everything needed for the edit/compile/link cycle (compiler, linker, headers, libraries, editor, shell) on the ramdisk and still have enough space (>100K) for my source files.

The compile/edit cycle is great when running under the graphical shell. First you edit the program, then compile. If the compiler finds bugs, the editor is reinvoked and loads your source file in one window and a file containing your error messages in another. The error messages even make sense! Since you are running under the ramdisk everything is very fast and convenient. It certainly blows away the DRI development environment in terms of productivity and ease of use.

If you don't need to compile programs that redirect i/o, or if you already have the developer's kit for compiling those kinds of programs (I do), then I heartily recommend Megamax C.

Subj: Line A variables at negative offsets, info wanted.

There are Line A variables at negative offsets from the Line A variables
base address returned by the $A000 opcode. See for instance the listing
of the HI50 program recently posted on the net and the info on the
position of the text cursor a while back. In the toolkit info I have
only the Line A variables at positive offsets are described.
Does anybody have a description of all the line A variables and their
meaning ? If so, please post it and/or mail to me.
It seems that with these 'negative' Line A variables you can implement
font loaders, change fonts, etc.
Thanks for any info.

  We have never received the macros needed for proff'ing the Progem info
or most of the Progem documents. Seems like ages since we've seen anything
at all from Case Western Reserve University, anyway, so maybe the news feed
is/was broken. Anyway, could we get this stuff mailed from someone nearby,
or posted if this is a widespread problem?

In the May 1986 issue of ST Applications (new magazine) there is
an advertisement for a company who is doing hardware upgrades of
SS drives to double sided. They advertisement reads
    "Send your SF354 disk drive unit (No power supplies please)
     with $120 plus shipping & handling to....."

The company is called "Komputer Korral" in Portales, NM.

Does anyone have any experience with this company, or with upgrading

their drives to double-sided?

(Please don't say "You should have thought about that BEFORE.....", since
 that statement is reserved for parents taking children on long
 automobile trips! :-)

I don't know about the company, but this sounds like a reasonable deal.
You can upgrade the unit youself, by replacing the actual floppy drive
with an Epson SMD-180 drive. You would would have to pay around $100
for the drive, and it would only take a few minutes to switch the drive
and bezel.

The Korral could make a nice profit, since they can buy the drives at
wholesale prices, and resell the old single sided drive to a repair
shop. Now why didn't I think of that?

Here is a very simple vt52 emulator for the st with function keys.
It is a quick hack designed to work with CMS systems. It defines
the arrow keys, the enter key, and f1-f10 are defined as CMS
function keys f1-f10. This was written using HIPPO-C (yes, you
can write things using HIPPO-C), and converting to DRI 'C' should
be straight forward.

To use, save this to disk, compile, and link with the -S option.
Move a:\a.prt to a:\vt52.tos and you're ready to go.
---------------------------- cut here ------------------------------
```
# include <stdio.h>
/*
     vt52.c - a very simple vt52 emulator with function keys
*/

# define ESC  0x1b

int c, k;

esc(s)
char *s;
{
     auxout(ESC);
     for(;*s;s++){
```

```
          while(!auxos());
          auxout(*s);
     }
}

main()
{
     while(1){
          while(auxis() < 0)
               putchar(auxin() & 0xff);
          if(conis() < 0){
               c = rawcin();
               k = c & 0xff;
               c = c >> 16;
               if(c < 0x3a) /* regular keyboard character */
                    auxout(k);

---------- cut here ----------
From Chris Sander in Heidelberg / SANDER@DHDEMBL5.BITNET

TDI has just released a new version of their MODULA-2
compiler, version 2.10a, with significant improvements:

... desk accessories are now supported
    by linking the desk accessory run time support
    module GEMACCX.LNK in place of GEMX.LNK
... desktop-like user interface
... one-step procedure to compile and link
... improved editor
... etc. etc.

We paid 25 pounds UK for the update.

They also offer a developer's tool kit, including
a symbolic debugger and a resource construction tool
called RSCMAKER. But we have not seen it yet.

TDI Software Inc.'s coordinates:

UK: 29 Alma Vale Road, Bristol BS8 2HL,   phone: UK-272-742796
US: 10410 Markison Road, Dallas, Texas 75238   phone: USA-214-348-4942

I intend to write a mini-review of the MODULA compiler soon.
If you mail your comments to me directly, I will try to
include them in the review.

Disclaimer: I could care less about TDI's profits.

Claimer: ... but I *am* interested in promoting MODULA-2.
          It certainly beats PASCAL, FORTRAN (what's that ?),
          and even C (if it weren't for UNIX) and ADA
          (M-2 is much smaller).

Keywords: AES, RCS

  I have been playing with a friends' development kit for a couple of days and have had some problems. To learn about the RCS, I made a resource with one dialog box and a small program to listen to it with EVENT_BUTTON. The dialog box is set up like this:

  The 'Yes' and 'No' are BUTTONS with the RADIO_BUTN flag set, and the 'EXIT' is a BUTTON with DEFAULT and EXIT flags set. All three of these

are also SELECTABLE. The 'Yes' and 'No' are also 'children' to the BOX enclosing it, so the RADIO_BUTN flag should mean something. But I have troubles.

1) I have to have code to explicitly darken and lighten the 'Yes' and 'No' buttons with OBJC_CHANGE or else nothing happens. Am I misunderstanding the idea of radio buttons? I thought they would do this visual feedback for me. What is the use of the RADIO_BUTN flag?

2) The 'Exit' must be selected with a mouse click. The 'Return' key is always ignored. I *KNOW* this works in other programs; any ideas on what I am doing wrong? Do the EXIT and DEFAULT flags fight?

3) The RSRC_LOAD works fine, and fails as it should if the .RSC file is not found. I then do a FORM_ALERT to complain, and after accepting the abort option, I do a V_CLSVWK and an APPL_EXIT. The screen is then filled with randomly positioned flickering checkmarks and the system goes off to la-la land, requiring RESET. I don't know what else I must clean up to avoid this; any ideas? (It is a nice effect, though. :-))

I then tried to get a good stand-alone example that is clear without the RCS. I saved a copy of my resource with the 'Output' option set to 'produce a .C file' to get the data structures, and added this to my code. The RSRC_* routines went away and my OBJC_* functions now apply themselves directly to the "OBJECT rs_object[]" array. Then I tried it.

4) The dialog box now comes up tiny, about the size of a matchhead. None of the features are visible, unless you have a great imagination. It is possible to hit the 'Exit' button, but it takes great talent. And hitting the 'Exit' button is the only way out, remember.

Turns out the numbers are too small for all of the objects in the structure; they are in CURSOR coordinates, not PIXEL coordinates like I want. So are they stored differently in a loadable resource file? If so, why the difference? If not, what changes them to pixel coordinates whan I load/use the resource?

Obvious solution: translate all the coordinates to PIXEL coordinates. I tried this two ways: I got out my hand calculator and multiplied each x and width by (640/80) = 8, and each y and height by (400/25) = 16, and then I tried the RSRC_OBFIX routine on each member of the array on startup. Both approaches caused the same results, leading to ...

5) The BOX and BUTTON outlines are drawn first, with the text I expect being changed to gibberish. Then in from both sides come two great sweeps of grey, which blotto the boxes when they meet in the center. Then where the old 'Yes' box was supposed to be darkens and the areas where the 'No' and 'Exit' boxes were supposed to be lighten, as the initial OBJC_CHANGE calls take effect. Finally, the mouse cursor appears. Then I can poke at where the boxes were and get them to darken and lighten, just like before, except there are no outlines or text. (This, too, is a nice effect.)

Any help on how this stuff works would be appreciated. So would help on what changes to make to incorporate and use the .C output file from the RCS. I post a summary of any mail.

I have written a small program that installs an alternative keyboard tranlation table into TOS. The table is read as a (binary) file. I currently have a file which translates Backspace to rubout, Delete to ^D, and the arrow keys to what is needed for microEmacs. A file can be created for vi, say, using a simple C program I have also written. The numeric pad keys CAN be distinguished, if you want.

Catches: A key can only be translated to ONE ASCII code with this method. The installed table is used only by programs that call the usual TOS char input routine. Communication programs may bypass that upon some function keys, e.g. XMOTER preempts all F# keys and more.

Nevertheless, this method is an easy way to make life easier INSIDE existing programs/environments! Email if interested.

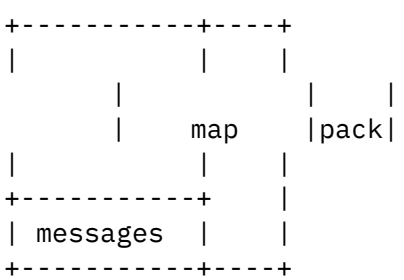
Just visited my local Atari-shop (Von's Computers) and saw three new products:

1) A clock module. This little beauty plugs into your ROM port and via an AUTO folder program and/or DA sets the system time from a battery powered clock (which looks kinda like a watch chip). I have no idea who makes this; I was busy playing with item three... Has any one heard of or have such a gizmo? I'm considering getting one... Cost: $45.00

2) Epyx has Temple of Apshai for the ST. The game includes the ENTIRE Apshai series in one game! Cost: $37.00

3) Last, and clearly the best. Epyz has Rogue for the ST. It's a graphically 'enhanced', windowed version which looks to be exceptionally well done. You have three windows:



The map window has a 'zoom" button to switch it from a 1/4 window scrolling map to a full map. The pack window shows icons of what you've picked up and expands to fill the whole screen giving details of each item. The message window gives you the normal rogue messages.

I played for about 20 minutes at my dealer and can hardly wait for the long weekend! Cost: $37.00

Keywords: it works

Thanks to all those who responded to my question about getting microemacs
v30 to run on the ST. Eventually I hit upon the idea of casting the pointers
it was trying to subtract to long, the compiler warnings went away, and it
linked fine. Since others have gotten the code to work "as is", I suspect
there is a bug in the version of the C compiler that came with my developer's
kit (which I just got a few weeks ago) that is not present in earlier
versions.

I dont know about the 1040, but when I first got my 520 i used it to give a
demo at our universities freshers fair.

It ran the slide show program solidly for about 6 hours without a problem.
With the slide show the disk drive motor is permanently on, but of course
it only reads, not writes, the disk.

Hi,

"mckay@ee.pordue.edu" review some nice games for the ST, but I have a
small question. I have a MONOchrome system, so lots of the COLOR stuff
wont work, while other stuff will work fine. It would be VERY nice if
from now on, when you (meaning any of you out there) review something,
could you please say in what resolution it runs in, and if it will run
in other resolutions? I would love to get rogue, but I wont be able to
until I find a dealer who has one or a friend, so I can test it to see
if it runs in monochrome. Thanks.

[Lineater ----> TRASH]

Hi Guys, More questions.

Does anyone know any way to read the name of an application or accessory
once it has been started (argv[0] to traditional `C' programmers). I've
been trying to get the info, but can't seem to find it. In particular,
I would like to have a single version of a RAM using accesory/program -
say an editor or ramdisk, and have it start up with the correct data
size just by changing the name.

Usual caveats apply: 1040, ROM TOS, Lattice C, PD assembler.

Any help, pointers, or workarounds appreciated.

Cheers,

Frank.

> --

How would the cost of the Unix licenses themselves affect the
cost of a Microcomputer running Berkeley Unix?

Could be, could be. I don't think its related to the XMODEM program, since
I seldom use capture mode. It could be that the line noise sandra refers to,

which I also get whenever I disconnect, might just have a ^S in it. If it did, would this cause the RS232 line to hang? Remember, turning the modem off doesn't do any good, only rebooting. Anybody else have comments/solutions?

The resistors go "in series" with the drivers. Then are not pull up resistors; rather they are there to minimize undershoot and dampen the ringing that occurs when driving an inductive/capacitive load.

Still waiting for that replacement power supply,

New Modula-2 from TDI Inc.:

TDI has released Version Two of here Modula/ST package. I saw it yesterday
at our dealer. Seems to be very nice. There are made greater corrections
to compiler, linker and libraries (hard disk (path) support, corrected STRINGS
module and so on). Also there are some more new details:

- own shell (speaking desktop manager) supporting multi module programs
- more libraries
- supports ACC's and hardware interrrupt handlers
- and some more things.

I hope that we will get the package very soon; than I will write a short
review about it.

A U.K. firm, Logic Replacement Technology Ltd. (tel +44 734 751087)
are developing an Ethernet interface for the Atari ST. It is to be
a daughterboard affair plugging into the 68000 socket, with the
68000 plugged into the daughterboard, where the Ether chips are
situated. They have a prototype working and are looking at the
production engineering. They are writing an implementation of TCP/IP
for TOS. They plan to show it at a UNIX show here (Olympia) June 3-5.

They haven't worked out a price yet, but I have heard 900 pounds
including the (1040?) ST rumoured.

I have no connection with the firm, other than as a potential
customer.

Hi - I saw a new monitor with a built in disk drive made by atari
for the 1040ST today. San Jose Computers had it at a swap meet. What
is the advantage of having the disk drive in the monitor? They also
had a double sided - 2 drive 520ST with color monitor for 899. That
seemed like a good deal.

I origionally bought my 520st cause I was told AT&T was porting UNIX to it.

If I was misled, boy it was costly.
I'll sell my 520st in a minute if they only come out for
in for the 1040, and buy one of those. I go through withdrawl without
a few ls's every hour or so 8-)

Any info on this (Neil are you out there?) would be greatly appreciated.
Please mail me and I'll sum up to the net if there is enough interest.

Scott

gordon@sage.cs.reading.Ac.Uk (Simon Gordon) Writes:
 (in message dated: Fri, 16-May-86 19:57:21 EDT)

<> Some people seem to get their facts twisted.

<> There seem to be two problems
<> 1) Some of the older power supplies cannot supply enough power if you have
<> the extra 16 ram chips to give 1 meg (my one is black with a lead out of
<> each end, ive been using it for a month since the 1 meg upgrade and rom upgrade
<> which i had done at the same time)
<> 2) With twice as many ram chips, the MMU must do extra work holding the
<> inputs to the ram chips at their normal voltage. The resisters are therefore
<> pull ups and do this job instead.

<> Simon Gordon @ Sibly Hall Reading University UK

Now from what I read, the resistors went in series between the
MMU and the ram chip RAS and CAS lines. If so, how can they be pull-ups
then?

```
MMU ]----/\/\/\/\-----[41256 RAM chips
        resistor
```

is not the same as a pullup configuration:

```
                      ^ Vcc
                      |
                      |

It is probably my fault, but my mail to some people keeps getting returned
by the malificent mailer daemon. You'd think if it can get to me, the reply
function will get it back to you, but in about 50% of the replies it does
not. <sigh>

None of these problems should be occuring. There is either something wrong
with your copy of AW+, or something funny about your hardware. Please send
me your AW+ disk so we can examine it, and I will send you a replacement.

------------------------------ cut here ------------------------------

WRITING DESK ACCESSORIES USING PERSONAL PASCAL

In order to make a Personal Pascal program into a desk accessory, you must perform a few operations which are not described in the manual. First of all, you must make sure your program can be made into an accessory as follows:

1. The start of your program should contain an S0 compiler directive. This command tells the compiler not to adjust the size of the stack.

2. You should NOT use debug mode. Either change the option setting called "Full debug mode", or use a D- command along with the S0 command.

3. The value actually returned by the Init_Gem routine is the application identification number for your program. You must save this number in a variable, instead of just testing it. Again, look at the sample accessory for details.

4. Two additional GEM messages are sent to accessories. These messages, AC_Open and AC_Close, are not declared in the GEMCONST.PAS file. You should either declare them in your program (as the sample accessory does) or add them to the GEMCONST.PAS include file. You also must respond to these messages as shown in the sample accessory.

5. You need to declare one more EXTERNAL function in your desk accessory program:

```
FUNCTION Menu_Register( ap_id : integer ; VAR name : Str255 ) : integer ;
  EXTERNAL ;
```

   This function already appears in the PASGEM library, but it does not appear in GEMSUBS.PAS (you can add it there, if you wish). Use the Menu_Register function to insert the name of your accessory in the "Desk" menu. See the sample accessory for details.

Next, you need to create a file called PASACC.O by running the MAKEACC.PAS program listed below. You must enter a valid stack size; although you could use most any size, we recommend 5 Kbytes. After creating the PASACC.O file, link your program as follows:

1. You must link PASACC.O as the first link file, not the object file produced by your Pascal source program. Put the name of your Pascal object program in the "Additional Link Files" field of the link options dialog box.

2. Select the "Link..." item in the files menu. When the ITEM SELECTOR dialog appears, select the file PASACC.O-- remember, your program's .O file must already be in the "Additional Link Files" list!

3. The linker should load and link your program normally. The final output file will be named PASACC.PRG. Change this to any name, but give it the extension ".ACC" (this tells GEM to load the accessory upon booting). If you have an early version of GEM/TOS, you may need to name your file DESK3.ACC (the earliest version needed the "DESK#" primary name).

4. Copy your accessory file to a backup of your boot disk, and reboot your ST. The name of your accessory should appear under the "Desk" menu. If you select your accessory, it should run.

LISTING OF MAKEACC.PAS

```
PROGRAM Make_Accessory ;

  VAR
    stack_size : Integer ;
    answer : STRING ;

I have been writing some nice GEM applications in O.S.S. Personal Pascal, and I like the package a lot. However, there is one glaring fault in the GEM support: There is no way to access the blit routines (I think it's called RASTEROP in the DRI documentation.) Can anyone suggest a decent way to scroll the contents of a window in some other way, or give me a way to access these routines? Does anyone know if version 2 of P.P. will include support for these routines? It's kind of impossible to do anything with text with the current release because there is no way to move the contents of a window other than redrawing the whole thing. (s--l--o--w!)
   One other thing, the overheating 1040's must be a problem that only happens to some machines. After reading about it, I left mine on for 5 days with no problems-- the top of the machine didn't feel particularly hot, even. And I have done some heavy disk copying (>15 disks), with no meltdowns [or even mild radiation leaks :-)]

  I made some progress with my problem over the weekend. Turns out that the '.C' output of the RCS does not do a complete job at filling in the structures. When it wants to install a pointer to *rs_strings[5] in the rs_object[] array, it puts a '5L' as a place marker - period. This is just a reminder to the user to fix things up properly, and if you don't go and do it, you're screwed. All those funny pointers cause lots of problems for the OBJC_* routines! Also, I lied : the RSRC_OBFIX does not fix the rs_object[] entries to PIXEL coordinates, it just screws up the program.

  So now I am disappointed in the RCS. If it will produce a '.C' file at all, it should do it right. It would be simple to write a filter to fix the output, since the rules are quite simple, so it should also be simple to do it right. It should also put out PIXEL coordinates. With the limitations in the linker and compiler, I suppose this isn't so

awful, but it is so GREAT in other ways that this fix would be nice.

  I'm still having trouble with radio buttons and default/exit, though.

Ever wondered why the second mouse button is not used by the GEM desktop? Well, it is ...:-) As always, its these undocumented features that prolong the enjoyment of using a system and make it more of an adventure. Anyway, to the matter at hand.

Imagine you have two windows open on the desktop, one for drive A and the other for drive B. If, say, the window for drive A is the active window, but you want to copy a file from window B to window A, you don't have to click on window B 40 times for things to happen. Simply hold down the right mouse button, while you position the pointer over the file in the inactive window. Now, keeping the right mouse button down, click on the left mouse button and drag the icon to the active window. Release both buttons and the file will be copied without the active window being changed! Similarly, you can also run a program which is sitting in an inactive window using a right-down-left-double-click.

Have fun!

Summary: OS-9 68K F-77 and Pascal

While I can't comment on the versions you have asked about, the new OS-9 68K port for the Atari 1040ST will be available shortly. There is a good Pascal (essentially ISO with some minor differences--I have the manuals and can check the variations for you if necessary) and Fortran-77 is due out a bit later this summer. There is also a 3rd

party Pascal by Omegasoft and 2 major database tools (Sculptor which is a 4th generation language/application generator and CSG-IMS which is apparently network oriented). OS-9 is beyond any doubt the most mature and fully developed of the modern *small* OS's available for the 68K family of processors. The only software base which I feel is better developed is full blown Unix, and Unix has drawbacks as well as advantages when compared to OS-9.

Cheers! -- Jim O.

Does anyone know of a software screen dimmer for the ST? It seems that for someone who knows how to do a desk accessory and handle the screen and keyborad it should be easy. What I am looking for is something to darker the screen after the keyboard and mouse have been inactive. I read an add somewhere for such a device which was a part of some other product, any ideas? Thanx. /bill

What is the GPO connection on the monitor jack for, also is there a
composite color output? Thanks

Bill

Your program would work fine in a system with no other interrupts, however that is not the case on the ST. There are a number of interrupts that occur on a regular basis (vertical retrace, keyboard etc.) It is quite likely that your timer will go off while one of these routines is being serviced. It is also quite likely that one of these routines is using D7.

What you need to do is establish a different mechanism for communicating between the interrupt routine and the main program. The easiest method is to declare some space in the interrupt procedure, preceeding it with a label, and use PC relative addressing to access it. If you save A4 in the space then you can directly access C global variables from your interrupt procedure.

The following listing includes these modifications to your original program.

```
==========================================================
#include <stdio.h>
#include <osbind.h>

extern int my_timer_code ();
long count;

asm {
    my_timer_code:
        move.l  A4, -(A7)
        move.l  save_a4(PC), A4     /* Restore A4 */
        addq.l  #1, count(A4)       /* Just count interrupts */
        move.b  #0xDF,0xFFFA0F      /* Clear ISRA Timer A bit */
        move.l  (A7)+, A4
        rte

    save_a4:
        dc.l    0
    }

main()
{
    register int i;
    int (*my_interrupt_handler) ();
```

```
    asm {   /* Save A4 for use in interrupt routine */
        lea     save_a4(PC), A0
        move.l  A4, (A0)
    }
    my_interrupt_handler = my_timer_code; /* point to my interrupt */

    Xbtimer (0,1,100,my_interrupt_handler);  /* Enable timer A, prescale 4
                                                for 100 counts (100us ?) */

    for (i = 0; i < 30000; i++)
        ;

    Xbtimer (0,0,0,0L);

    printf ("Timer timed out %ld times.\n", count);
}
```

```

The PS3000 is a color monitor with a built-in single sided floppy drive.
This product is available in very limited quantities and is being test
marketed in California only.  The advantage of this is to reduce the ST
system's "footprint" -- the amount of desk space the system takes up.

You can access any system call using Personal Pascal. Some are explicitely defined, and others must be defined by the user. Have you seen the text files from OSS? Originally placed the OSS BBS, these are also on CompuServe and BIX now. They explain how to use the AES, VDI, and BIOS calls that are not pre-defined. Maybe we should get these posted on the net...

Did the Atari Explorer magazine die a quiet death? After the first four (?) issues, it seemingly has vanished into the vaporware warehouse. Perhaps it was prophetic that the last issue had a black cover?

I've got sereral (or maybe one) versions of uemacs working the ST now but all suffer from one major mis-feature. When you scroll, the status line goes 'winging' on up the screen (delete lines) then heads back down to the bottom (insert lines). This is so annoying to me that I just put the disk away and went back to using MegaMax's editor (which is REAL pain as well). Has anyone put ST specific screen IO into a uemacs?

Speaking of MegaMax's editor.... does anyone else feel that when you use CURSOR keys, it's the *CURSOR* that should move? In case you haven't seen this *GEM* of an editor (pun intended) the cursor keys move the screen, leaving the text cursor where ever it happens to be. And that includes when the cursor is OFF the screen!! The ONLY way the position the cursor is to point and 'click'. Hunky dory aye?
Sheesh.....
Anyone recommend a really great editor... like one that allows lines > 80 columns 8^).

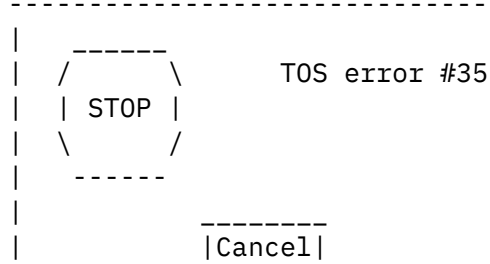
OK, I believe that this program works. However when I try to run it on
my 520, it doesn't :-). I have a standard, monochrome, 2xsingle-sided
disk, 520. No memory upgrade. I get a smart little box that says:



```
           |           --------           |
           --------------------------------
```

Anybody wanna tell me what's wrong ?? I would look it up in the manuals,
except that the Dev. Kit manuals I have are such bad photocopies and are
largely irrelevant... (Neil, how soon do we get *real* manuals ?? :-)

Simon Gordon, in an exasperated sounding posting, remarks that language
implementors are ripping users off by claiming that their languages provide
full Gem support when in fact they don't. I must disagree. I have used
TDI Modula-2 to write simple programs which use Gem (and they provide
a nifty program which uses pretty much all of VDI as a demo). The newest
version of TDI Modula-2 (they should be shipping it around now) is supposed
to come with a redone version of DRI's Resource Construction Set (different
bugs, presumably) and with source code for two desk accessories: a RAMdisk
and a print spooler.

Similarly, Personal Pascal can be used to write DA's. I don't know how, since
I don't use it. But I have seen extensive remarks on this subject on BIX

(the BYTE Information eXchange). I believe that OSS will send out information on this stuff to any registered user of the package.

There certainly are poor language implementations around (and I have a few gripes about TDI Modula-2). But the vendors *are* trying. Give them credit for that.

UNIX like any other multiprocessing OS is very unstable with out
hardware memory management. Even on a system that would be a
'single user' only environment, that user would want to run more
than one process at a time (printing, mail, uucp). With out the memory
management hardware crashing one program would could crash everything, yuck.

The 520 nor the 1040 have this hardware, although it could probably
be tack on. So if you need a ls fix from your 520, look into UNIX-like
shells that run on it.

Indeed this reminds me of a problem. Some time ago we massively installed EPROM TOS (because ROM TOS was available late in Europe and secondly we don't believe ROM TOS is bugfree enough yet). We used 250 nSec. access time EPROMs based on the fact that a US component suppliers uses(used ?) those.

We found similar problems (you can't move the sliders of the control panel and closing the control panel often causes fail/reboot).
Though Eric has no EPROM's, the similarity of the problems causes me to suspect that your machine has access time problems on the ROM's, probably due to extreme tolerances of several components. In that case you better exchange it !

General ADVICE on TOS EPROM's :
==========

We found out that the critical requirement for ROM or EPROM's in the 520ST is that data out should be valid 200 nSec. after applying Chip Enable. The original Atari ROM's are OK (of course).
If you have had EPROM's installed, you should verify the access time of the particular type that your supplier gave you. 250 nSec. EPROM's do not meet the requirements and may cause unexplainable system unreliability (like Eric has). You do need 200 nSec access time EPROMs theoretically, although certain brands or batches of 250 nSec EPROM's work. I wouldn't entrust my data to them though. We are now using 200 nSec. access time 32k*8 CMOS EPROM's without problems.

Some confusing FACTS :

If you have too slow EPROM's you cannot find out by repeatedly checksumming or otherwise testing the ROM area. Accessing them as data works fine. Executing from them only causes these problem. (can you imagine the time we wasted !?)

Atari has a warning out that certain brands of EPROM's do not work. They do not mention an access time problem, nor do they specify access time requirements. We found no brand related problems, just access time problems.

Neil (@ Atari), I would like your comments.

Keywords: Problems with "vi"

We have a 520ST but can't get it to quite work with vi under vt52. Is there 1) Something we're doing wrong?, 2) A slightly different termcap that should be used instead or 3) a program that fixes the problem?

A response from people who have and have not had success are both desired. I know this must have shown up before but we weren't paying close attention until we got one.

There is a need to share the labor of moderating info-atari. At present
we have two people performing this task. It would be very helpful if
we could spread the work among a few more volunteers.

The work is not hard. It consists of scanning incoming messages, discarding
the ones of the form "host temporarily unreachable," and adding and
deleting people from the distribution lists.

The lists are maintained on this TOPS-20 host. I can provide enough manuals
to enable anyone to learn enough about TOPS-20 to help us. It will be
necessary to log into Score, so perhaps folks on gatewayed networks
can't help.

Please respond if you have an interest in seeing this distribution list
continue high quality operation.

compatibility. Currently it can run full MSDOS. We are still engineering PCDOS capability, plus some of the tricky parts of the system that would allow programs like Flight Simulator and Lotus 1-2-3 to work. There is no word yet on the final configuration of this product, or on price or firm availability. We expect to see this in the Fall.

The people at Solar Powered Software, 1807 N. Evergreen, Chandler, AZ 85224,
make a set of products that includes a crt saver. After the keyboard has
been inactive for about a minute, the crt goes black. This function can be
disabled if you want.

I recommend that you go for the whole set, which is called SolaPak. In
addition to the crt saver, it includes an auto-booting ramdisk of adjustable
size (by editing a text file) and a print spooler/formatter.

No. Not possible unless you have cooperation from the process that
Pexec()'d your application. GEMDOS does not pass or preserve the name
of the program that was loaded. The desktop does not cooperate.

This misfeature is a result of the way commandline arguments are
passed to an application. It's been a problem --- in the CP/M and
MSDOS model operating systems --- since the first CP/M-80 C compilers
came out....

Computer Curriculum Corp. in Palo Alto has a gizmo to tie a roomful of ST's
together around a central host. I don't know the details, but I have seen
it in use and it does work. They have some nice CAI programs that use the
ST as a terminal, too.

The number of STarter kits copied and mailed is fast approaching 100.
That gives you an idea of the amount of copying required by this operation.
In order to speed up the copying I am requesting that people sending disks
to me format those disks SINGLE SIDED and not double sided. I am afraid I
only have single sided disks.

Some people have asked if they could return the favor. The answer is yes.
If you are about to send me disks and have some PD software lying around I
would be grateful if you put it on your disks before you send them. Some
people have already sent me some fine pieces of software and some of these
have found their way into the STarter kit. Also, if you have any SONY disk
labels or equivalent (gloosy appearance - pencil doesn't show well) that you
don't need I would appreciate receiving some. If you send 5 yellow and 5 green
labels to me I will pay for the return postage (in US and Canada only).
Remember, I do not expect to receive anything in return for the copying so
don't feel you shouldn't send any disks because you don't have software or
labels to give me.

Finally two notes on the objective of this operation.

1. The main objective is to provide new ST users with some working software that immediately makes their machines useable. The software provided in the STarter kit is, with a few exceptions, good but not quite finished products - mostly everything has some (nearly always non-serious) deficiency. It is expected that users receiving the STarter kit will eventually acquire commercial grade software that replaces the material in the STarter kit. I mention this because I have sensed that a few people were disappointed with some pieces in the kit. Please don't be disappointed - remember that the objective is to get people off the ground quickly.

2. Another objective is to provide this software to a significant number of new users. This is most efficiently accomplished if people receiving the kit spread it around locally - perhaps through ST user groups. Many of you have already done this. In a few cases, however, I have received copying requests from people working in the same building or living within blocks of each other. In one case someone sent a second set of four disks without a note - presumably checking to see if any new stuff had been added lately. This copying is not easy. Please help me by being local distributors and by not requesting copying if you already know someone who has received the kit (unless, of course, he is a dirty rat and won't let you have the stuff).

Thank you, all.

Once again my 520ST is screwed up. This time every time I try to do just about anything with the control panel, the system reboots. Often when I change the date, the background color near the cursor will be wrong.

Sometimes some dots on the screen are wrong.

I have ROM TOS and a mono screen.

A while ago people were discussing the alleged reliability of ATARI ST COMPUTERS. I have had nothing but problems with mine. My first ST lasted about three days until it wouldn't boot (the disk drive would make a terrible noise, etc). The next ST had an unstable screen (text & graphics would quiver slightly). Finally this one is screwed up also.

The last time I sent in a computer to ATARI product servce, it took over 6 weeks to get my system back. They were ready to ship very soon after they got my unit, but because they were doing inventory, they kept the unit (ready to ship) in the fucking warehouse for about 3 weeks.

This is the kind of treatment I got with my Commodore-64. It looks like ATARI is unprepared both to produce a reliable product and to provide adequate support.

Atari has definitely licensed UNIX from AT&T. If nothing else, that convinces me they have a machine in the works, because presumably it cost them money, and ol' J.T. isn't going to spend ten cents unless he has to, from what I've seen! The rumors I've heard say that the machine will be an add-on box to the ST and will use the ST as a front-end processor. It will have a 68020, the blitter chip mentioned in the March BYTE article, and an enhanced, faster version of the ST video shifter chip. I seem to remember reading someplace that the V.shifter can run at 32 MHz instead of 16. If so, that would double the amount of data it can get from memory, and double the number of bit planes, which would give: 256 colors in low-res 16 in medium, and 4 in high. Coincidentally, or

perhaps not so coincidentally, I've heard in a few places that the 32-bit Atari will do 256 colors in low-res. Perhaps this is what they are doing? I don't know THAT much about hardware so if this isn't possible someone please tell me.
   Also, have people read the editorial in the June issue of COMPUTE? Looks like they are going to be starting an ST magazine or something.. how fine..

I have a 1040 ST and it has an internal DS drive. I can format, read, and write either SS or DS diskettes in it. All software that I have seen for the ST has been distributed on SS diskettes, including the packaged software that came from Atari with the machine (First Word, ST BASIC, LOGO, and NEOchrome). The DS drive can determine whether or not the diskette is SS or DS. You cannot read DS formatted diskettes on SD drives, however. I would recommend the DS drive (possibly two of them if you can afford it, since copying files in GEM can be a real pain in the *** if you only have 1 drive. I would also recommend that you grab the sources for the RAMDISK that was posted recently. It makes a big difference!) If you have any further questions, please let me know. I think that this is a great way to learn about the machine before actually using it!

In article <365@imagen.UUCP> turner@imagen.UUCP writes:
>i (in the form of my company) just paid for your ideas being transmitted

This is utter nonsense. You paid nothing. You don't own Imagen, and it
seems the higher-ups (making a few assumptions here...) are content
to have what traffic they may on Imagen's machines via USENET.
Saying "I, through my company" is a baldfaced argumentative trick
designed to give your words more weight than they would otherwise deserve.
Cut it out.

>> You can send whatever you want at your expense, but when you ask
>> me to pay for it (even implicity) you give me the right
>> to interfer with it.
>horse puckey! first who said that the free (read 'uncensored')
>exchange of ideas was free (read 'without cost')? it ain't
>second, you have a right to censored what you recieve at your
>machine but not what passes thru it. the system i am building
>based on email, hence if you are not a newsfeed you bear none of the
>costs, if on the other hand you are a newsfeed to others then you
>have given your implicit consent to bear the costs of a newsfeed.
>
>either you're from Stanford and don't know english or UC Berkeley and
>don't know math, but you mean function not correlation
```

>(the original joke was MIT and Harvard and has lost alot in the
>translation)

It has lost much more through its grossly incoherent presentation.
I have read the above passage about 4 times, and can still not decide
what you mean, Mr. Turner.

To confront the points as given, I agree that intercepting mail passing
through one's machine is very bad form, and people should stop doing
this unless entirely necessary due to technical constraints. Although
there is no WRITTEN contract, the custom of USENET is to let mail articles
pass at will. News custom is similar except that articles are expected
to stay within the confines of the newsgroup subject area.

Deleting mail for whatever reason disobeys the spirit of the arrangement.
When one considers that USENET is entirely voluntary, this kind of
pigheaded authoritarianism makes no sense at all. When one considers
the traditions of the countries where USENET exists (liberal democracies),
this kind of behaviour is entirely unacceptable. Far better a well-stated
policy (eg. no Net.flame) than a capricious enforcement of unspoken bias.

>Name: James M. Turner (not the James M. Turner at Lisp Machine Inc.)

There has been much talk lately along the lines of "why should I pay for
atari sources?". My response is as follows:

Clearly, the only way to regulate news traffic is by selectively carrying
certain newsgroups. If certain machines don't want ST sources, then
don't carry net.micro.atari16. Alternatively, create mod.sources.atari.
It happens in every micro group when it gets big, and this case is no
different.

I would add, however, that whining about the existence of an
atari source group in the face of the similar Macintosh newsgroups
is nothing short of inane. Net.sources.mac is number 1 in volume
month after month. People on the net clearly desire the group,
so there is no reason why it should not exist. If it costs too much
to carry, don't get it on your machine.

In short, stop wailing officiously about cost and do something, you whiners!
Put up or shut up !!!

Keywords: what is it?

Does anyone out there know what the proprietary file transfer protocol
Mark of the Unicorn distributes with PC InterComm is? I bought the
program about two months ago, and so far all I've done with this is
zip past it when making choices. Is it good for anything? Does it have
any bells and whistles that make it a better file transfer protocol than
kermit or xmodem? Does it even work?

So far lots of people have made passing reference to this or other
terminal emulator programs and I'm convinced that this is the best in
comparison with what I've read in this news group, but nobody has even
mentioned the proprietary protocol.

Is MOTU out there (I'm pretty sure they are), have you any comments or
insights?

Shalom,   -Leo

Maybe I've got the weirdest solution to this problem:
I've written a short program which redirects console output
(using BIOS calls) to both console and serial line.
That's rather simple to do, but I don't have access to this
atari in the moment, so I can't post the program now.
On the rs232 line I had a UN*X host running "cat >file".
After finishing SID, I connected to the host, typed EOF
and transmitted the file with kermit. I did not manage to
modify my program to write onto disk instead of the rs232 line,
maybe someone wants to try it ? I would be a valuable tool sometimes.

Hi,

I am planning to purhase a 1040 ST, but I don't anymore about the machine beyond the hardware configuration. Could someone on the net give some infor on the software, programming laugages, and printers that are available on the ST. Also I would like to hear some hand-on exprience from some current owners.

Thanks in advance.

Nelson
PS: The programming laugaages I am interesed in the most are LISP, C, and Pascal.

Hello,

I was wondering. Is there a software reset available on the ST? I find it disturbing to have to do a hardware-reset (that little switch in the back) every time I reset my 520. Sometimes I just wanna free up memory or re-boot desk accessories. But I am forced to reset it in hardware. Maybe someone could write a short program that did the job. I dunno. Or place it in a desk ACC. My ole c64 ONLY had a software reset, now my ST ONLY has a hardware reset. Any ideas and info is appreciated. Feel free to reply privatly or on the network.

I find this whole discussion rather offensive. Indeed, this whole newsgroup should not exist if one is going to construe things narrowly. (Our department owns not one ST, and I doubt that it will ever buy one. Most members of the net are in the same position.)

Asking someone to E-mail some public domain code is, as far as I'm concerned, a reasonable use of the net. (It might be even better to ask for the code to be posted.) Any ST-related stuff of a non-commercial nature ought to be grist for net.micro.atari16's mill.

For Tramiel's sake, let's get back to some sensible discussion!

(as our hero mounts his high horse, he turns and says....)

if we were dealing in machines and not people i would agree with you
but we are not. Allow me to stretch a point, you surely expect your
company to light your office, provide furniture, health bennies etc.
why ? UNIX machine do not need any of those ! We are dealing in
people here and (at least) i do not live by unix alone. and i will
mention net.cooks, rec, motss etc. the beauty of the net is its
breadth of interests, its exciting to feel that you're not just tied
into another techno-nerd net.

Has anyone tried to put any of the new 1 Meg dynamic ram
chips in either the 520 or 1040 ST? I'm specifically thinking
of the Fujitsu MB811000 1048,576 X 1 device. I can get
them really cheap... :-) The big problem I see is that
it's an Nmos device and probably draws too much power.
Anyone have experience?

What I meant to ask was if such a scheme existed which could be used on
an image file from within a program; in that way a "slideshow" or "animated"
demo/tutorial would be able to be more miserly with it's use of disc for
the images. I am thinking of run-length-encoding schemes, but have yet
to see anyone talk about it here on the net.

If Atari could produce a cheap (< $2000) Unix Box that ran Berkeley Unix,
I and about 500,000 other people would buy them as fast as we could write
the checks. (hint hint)

Also, unfortunately, it is ridiculously slow. It runs several
minutes(!) on hello.c style programs, and becomes the main slowdown in
a compile-link-debug -edit cycle.

> fixed.

Agreed. I wouldn't buy it. I would get the developers kit from Atari instead.
(I have not used the Atari kit but haven't heard complaints.)

[munch, munch]

Just thought I would pass on a mild warning about using RELMOD, from the developer's kit. It does not give out any diagnostic when confronted with a full disk write error, it just gives up and returns like everything went okay... Not a major problem, but annoying.

I know the subject has been discussed before, but... did anyone ever find out a commercially available RGB->Composite converter, at a reasonable price ? I don't particularly want to wire my own (seeing as my analog electronic skills are not up to snuff...) Surely there must be SOME demand for this product...

thanks

I would think that some adaptation of the algorithm used in compress
(available from mod.sources and quite protable) might be sufficiently fast
enough to do what you want. Compress is not restricted to ASCII files. We
use it to compress cpio output (used for backups) before sending to a VMS
VAX. We get (typically) about 50% compression and its speed is acceptably
fast.

< Flaming Portion Deleted >

> - Joel ({allegra,ihnp4,seismo}!uwvax!uwmacc!oyster)

Well, I've already responded to the portion accusing Commodore of
abusing the net and being a bad net.citizen by email. (and haven't
heard anything back from Joel in response. (Basically, I just
paraphrased George Robbins posting, pointing out that we feed news/mail
around, and have to fight for our phone lines/charges like any other company,
and that usenet was an own-time occupation for the engineers here)

Now, to make it real clear WHY I wanted to respond to that initial message...

<Flame On >

It was the line "I don't WISH to pay".

That was the trigger. I have nothing against sources for *any* machine
being posted. I can almost always learn something from any source, even if
I don't happen to use that machine. (that's why I don't like binaries, but
that's something else).
No, what I was commenting on was the *rather have someone else pay for
something I want* attitude in that initial posting.
The request wasn't *Please email/post because I can't afford them* or
Please email/post because I can't get them otherwise, but
I'd rather have someone else pay
Whether the stuff is posted, or emailed makes no difference to my
dislike of that attitude.

<Flame Off >

(To the initial poster: sorry about all the fuss. I wasn't
really attacking you personally :-) By the way, since you want to
use the stuff for your work, why not see if your company/university/whatever
will pick up your phone bill ? (assuming the stuff isn't posted, that is)

I regret that I cannot send the file compaction programs out. My computer is crashed, and will soon be making its second journey to Sunnyvale.

I'll send the programs when the computer is back, but based on my last experience, it may take up to two months.

For a serious Atari dealer, try:

Applied Computers, Inc. Phone: (301) 948-0256
16220 Frederick Road (800) 4-ATARIS
Gaithersburg, MD 20877 (I *said* they were a serious Atari dealer!)

They seem like nice folks and have a good stock of hardware, software, books, and magazines. I have not had serious dealings with them other than to buy books, but I got good vibes about them from my one visit.

Incidentally, they are located at the intersection of Shady Grove Road and Frederick Road (Rt. 355), on the southwest corner, about the second business from the corner. (Don't make the mistake I did of looking for 16220 up north of the center of Gaithersburg!)

Good luck!

Don't suppose it ever occured to you that I might use/own *BOTH* an Atari ST *AND* an Amiga, huh? No I guess not. And if it had been an Atari official voiceing his opinion , I'd have supportted his right to do so also.
I'm 'company blind'. So long as they don't output downright advertisements here, I don't mind. It gives me a chance to communicate with people I might never get to meet, and could only read about 3 monthes later in a magazine.

Anyways you feel your way and I'll feel mine.

But your right, back to something useful.

********** A little help please *******

Here's a short routine written in the release version of MegaMax C
It bombs miserably (address errors). I'm typing it from memory, so forgive me if it's not perfect, however the routine DOES compile and link without errors at home on my machine.

Now it seems to load and start running, because there is a definite delay between the 'here we go' and the 3 bombs.
Makes me think it's either a stack overflow or something trashed in the Xbtimer call or after the loop exits. I hate these problems as they always turn out to be simple. But I'm at a loss. Any Ideas?

BTW, I have seen Russ W.'s code example for the 50hz GEM timer interrupt, where he saves A4. He says otherwise it gets trashed. I don't think that applies here. I'm not passing control to any GEM function so I don't think A4 can get trashed. Indeed looking at bios for Xbtimer shows that it simply moves my vector into $134 which is the 13th MFP vector. So only my routine should get control at the interrupt. Right? Wrong?
PS. Whats the clock rate for the MFP and the MFP timers? They can be clocked separatly. Are they?

Thanks for the help in advance

```
/***********************************
        My Time Int.
***********************************/

#include <stdio.h>

extern int my_timer_code ();

asm {
      my_timer_code:
          addq.l   #1,D7          /* Just count interrupts */
          move.b   #0xDF,0xFFFA0F /* Clear ISRA Timer A bit */
          rte
    }

main()
{
```

```
     register long count = 0;     /* Count of interrupts */
     register int i;
    int (*my_interrupt_handler) ();

     my_interrupt_handler = my_timer_code; /* point to my interrupt */

     Xbtimer (0,1,100,my_interrupt_handler);  /* Enable timer A, prescale 4
                                                 for 100 counts (100us ?) */

    for (i = 0; i < 30000; i++)
         ;

     Xbtimer (0,0,0,0L);

     printf ("Timer timed out %d times.\n");
}

In my interrupt example I forgot (I think) to include the ",count"
in the last printf. Rest assured it still bombs. As I said I was
typing from memory.  Count being a register variable should be in
D7 since it's declared as the FIRST data register variable and
MegaMax allocates registers in reverse order starting with D7.

Anyways you get the idea.
Thanks again!

Personal Pascal does, in fact, allow you to create desk accessories WITHOUT
the resource construction set. Complete instructions are included on
CompuServe, BIX, and the OSS BBS. I will post it to the net ASAP.

Double-sided drives (SF314's) will read single-sided disks with no
problem. I do it all the time. Do *not* buy a single-sided drive--the
cost is almost the same (in Canada, at least), and you will rapidly
run out of disk space.

I think you might improve the reliability of your machine by doing the
1 meg upgrade. All that soldering may improve the connections to your
memory chips (seems to me that is where your problem is) and you can
resolder any additional suspicious looking connections. Also, while
you have the hood up you can reseat those custom chips that like to pop
out of their sockets during shipment. I gave this treatment to my
ST and I have not seen a problem since (5 months).

Be sure to take the usual anti-static precautions when messing around
inside.

You CAN write desk accessories in OSS Pascal! The directions were posted to
Compuserve along with a small routine you link with a quite normal OSS
Pascal program. I'll upload the directions and a sample DA if I get the
chance over the weekend...

Hello, everyone. I have just received the ST developer's kit in the mail.
Unfortunately, one of the disks (the one labeled RCS ICON) is unreadable.
Is there anyone in the New York area who has the developer's kit? If so,
please write email to me. I'd like to copy this disk, if possible.

A lot of study has gone into image compression, so I am sure you can find some
very effective algorithms. One of the simplest to understand is "run-length
coding", in which repeated data (pixel) values are sent as a special "repeat
code" followed by the repeat count and the value, or some such thing (invent
your own protocol if you like). For certain kinds of images, this results is

a substantial compression. E.g. line drawings where most space is white
anyway, or highly structured scenes where large regions have the same color
and little or no texture.

If you are constructing the image (i.e. have your mits on the semantics of the
scene) then you can do MUCH better with "Videotex" encoding. The North
American Presentation-Level Protocol (NAPLPS) does a surprisingly good job of
representing simple pictures etc. There is an ANSII standards group (X3H33?)
working on such things. With Videotex encoding (NAPLPS, Teletel, Prestel,
several other standards), pictures can be coded in a few thousand bytes and
therefore sent over even 1200-baud lines in a few seconds!

That's about all I know except I could probably get some specific references
to articles, standards documents, etc. if you can't scrounge them up locally.

Please stand by, this is my first use of the net as anything other
than a passive reader.

I once had a similar problem with my Concorde modem and the XMODEM
terminal emulator that was posted to the net as source a while back.
Whenever I went into file capture mode before I was connected to
some other machine, the <ctrl>S that was sent out would be echoed
back to my ST by the modem! Voila, nobody talks to anybody anymore!

I don't know if this is the problem of the first poster, since it is
fairly unlikely that spurious line noise would become ^S, but it sounds
possible for the second poster.

Originally I send an abbreviated form of this letter to Neil Harris (neil @ atari) but have not been able to get an answer so am now putting it on the net in an expanded version.

****

Neil Harris or anyone else on the net:
Are you aware of a bugs in the first version of Atariwriter+ that was sold? I bought one of the first copies in the plain white and black envelope. It has several bugs, one of which is fatal.

1) it does not consistently recognize the control E for ending a page. You must do repeated c/r's and control E's before it will go to next page. I often do this to insert blank pages in text for photographs and it is annoying to have to add more than one control E.
2) the fatal bug is its's incorrectly handling of text longer than one page long. It should go onto the next page, instead it takes the last few lines and places them at the top of the same page, clobbering commands and the first few lines. I do not know whether it has anything to do with control T, control B or control Y. I suspect, however, that it is tied in with the control E problem mentioned above. The end result is that you have to hand end every page in a long document. Sometimes control T or B works fine, then the next thing you know it causes the program to partially crash. When it crashes then condition 3) occurs and other commands also seem to go away.
3) one final bug, it occasionally loses the ability to save a file. You can sometimes get out of this with a RESET, but usually you must reload AW+ and if you did not already make a backup, you have lost your file. I have not yet been able to figure out what causes the save command to go away. It also looses other commands at times [see 2) above].

The net result of this is that I am quite unhappy with laying out $50 for AW+ and having these quite fatal bugs in it. Are these bugs known to Atari and is there a fix or can I obtain a new disk, with the errors fixed?

Thanks in advance,

William Dippert

Some people reported having troubles when using more than a certain number of directories on their ST. This seems to be true and not true depending how one looks at it. I experimented around and found the following:

You CAN have definitely more than 20 (or 40 depending which hard disk driver you are using) directories. This limitation applies only to directories which are 'seen' (or 'active') by gemdos. This definitely allows you to have i.E. 10 directories in the root directory and 10 subdirectories in each of them (= 101 directories). You just can't activate (= list them, cd to them) all during the 'life' of your current TOS (failures are noticed by messages like: YOU CANT RUN THIS APPLICATION. THERE IS NOT ENOUGH MEMORY) which means ->reboot.

Above error messages prevent you from further using the current life operating system until reboot. But if one doesnt use windows (AES and VDI) at all one doesnt appear to have this problem. By not using VDI and AES one even can get almost 64kbyte more out of the memory (that seems to be the amount allocated by AES and VDI). How to do it? If you have a CLI (like command.prg) just put it in the AUTO directory of your BOOT disk and it comes up without VDI and AES plus more memory. If one does just compilation or other software development one doesn't need these parts of GEM.

In the case of too many directories I have experienced that one just can't make new directories but everything else seems to work.

If anyone else has different experience or something to add please share it with us here on the net. Happy computing.

Hi,

As an owner of Lattice C, I am rather annoyed that I can't write desk
accessories. There is no provision for anything other than a standard
application startup. What I would really like from the net is some
details of what the ST actually requires when starting an application,
or an accessory, or any other type of program it might support.

I have the First Publishing/Abacus books 'Atari ST internals' and 'GEM
on the atari ST' and they are blatantly developers-pack books. Even for
the assembler-code examples, they say 'and be sure to include your
startup files'. What do these files contain? Is there any chance of
some public-domain versions? Are there any books that explain details
like this?
```

As far as I am aware, you can't get documentation like this at all
without the developers pack - please prove me wrong!

As usual, any help, pointers etc appreciated. Mail brightens my whole
day.

Cheers,
Frank.

One point that may clear up some confusion. When you hang too much load on
a circuit like the MMU, this does at least three things:

1. It causes a DROP in the voltage at the load.
2. It causes more current to flow through the source device, even though
    each individual load device may draw a slightly reduced current.
3. It causes an INCREASE in the voltage drop ACROSS COMPONENTS INSIDE THE
    MMU, and thus an increase in power dissipation there.

What is especially damaging is when the driving circuit (MMU in this case) is
so overworked that it goes out of "saturated mode", in which the voltage drop
inside the switching transistors is very low, and into a "linear" mode in
which substantial voltages can develop, say, across base-collector junctions.

Substantial may mean 2 or 3 volts instead of the normal 0.2 or so. Multiply this by a 2x increase in current, and you can see why something might fail.

I haven't investigated the ST upgrade problem, and in fact don't own an ST yet, but I suspect this is what is going on.

Has anyone in netland found a way to use surplus 8 bit Atari's for printer buffers, either for other 8 bit Atari's or for 16 bit ST's???

It would seem to me that somehow the joystick ports could be used to connect spare 1200XL's or 800XL's and give a very nice 64k printer buffer. For my own requirements, I want to be able to use a 64k 1200XL to act as a printer buffer for either a 130XE (128k), 800XLE (256k) or 1200XLE (256k) 8bit computers -- connected to either a 1027 printer directly or thru an 850 interface to a centronics parallel printer port. I am certain that for either 8 or 16 bit applications, some form of software driver would have to be written, hopefully the electronics would be no more than connecting two joystick ports together.

Thanks in advance,
--Bill--

COMPILER PACKAGES for ATARI 1040 ST

Hello,

I've just negotiated with the bank manager for a 1040 ST. I was wondering if anyone could send me any comments on the follow PASCAL compilers:-

USCD PASCAL	price	74.75	pounds sterling inc VAT
Meta PASCAL (Metacomco)		89.95	inc VAT
Pro PASCAL (Prospero)		129.95	inc VAT

And also has anyone any comments on the following FORTRAN-77 compilers

USCD F-77		??.??
Pro F-77	(Prospero)	129.95

Thanks alot

Gareth

Somebody requested a copy.ttp in a recent ST Wish list.
Here's mine.
usage is :
 copy infile1 outfile1 [infile2 outfile2 ...]

In case of an error, the error message is displayed and then
the program waits for any key to be struck. This is because
of the failure of the desktop to have a little patience ... error
messages usually disappear....

Although it's not official policy here at the lab where I work, we have found that an effective way to deal with this sort of situation is to call them up every day and ask them what is going on. If you get less than satisfactory answers, get the person's name and ask to talk to management personnel. This usually produces quick shipments. Be sure when you deal with a company that you get a phone number where you can have the order tracked down.

We bugged Digital for weeks when our uVax II didn't arrive on time. We'd call them up every day: "Where's our Vax?". The answers were usually pretty funny. :-)

Oh yes, I also should add that *anytime* you deal with someone through the
mail (ordering, having fixed, etc.) you should:

1. Wait about a week. (for things to get to you, for your order to get there)
2. Call them and check on the order. (unless you've already received it)
3. Make sure they've got the order.
4. See if they've shipped it.
5. Find out when they're going to ship it and HOLD THEM TO THAT DATE.

By bringing attention to the order, you'll get it out of the TO DO pile and
in motion. It also gives you ammunition should they start delaying. "Gee
I called and YOU SAID it would be shipped Friday". Once again, if all else
fails, start taking down names and calling up management.

GST is the company that supply first word.
They also sell a very good text editor, macro assembler, and an integer only c.
If you have ever used the metacomco languages you will know that they can
produce 2 formatsd of binary file, the .o for linking with link68, and .bin
for linking with the linker actualy supplied which is the GST linker.

Hope that clears things up a bit

>   {John}

Aha. They are working on 5 different levels - last count! Or at least
that's what they told me on the 'phone. Paraphrasing and deciphering the
sales literature, I concluded this: the whole system is called AtariNet,
with two levels known as PunchNet (19200 baud RS232 - i.e. ULC (Ultra Low
Cost) CSMA-CD), and MegaNet (40Mbit optical fibre link). What are the other
3 levels you ask? One is Ethernet compatible (I guess this means 10Mbit
data rate and very little other similarity), another is 1Mbit, and the last
was quoted on the 'phone as 560MBit..... All the networks can be connected
to an Atari, and the latter used as a bridge between them. They use their
own protocols, and FEPs for high data rates (a 6809 board was quoted for
the 'Ethernet' system). PunchNet and MegaNet are supposedly available, but
something about the brochure makes me uneasy.

I hope they come up with something, but what would be really nice is a simple
Ethernet box, which doesn't impose a protocol, so I can connect my AtariBox
to the Ether using whatever protocol we go for locally.

     Nigel Roles (...!mcvax!ukc!minster!nigel)
     Department of Computer Science
     University of York

PS I note that your quote from A.C.O.R.N. incorrectly spells "compatible" in
just the same way the letter I have from Software Punch - I wonder if they
are by any chance related?

On the Macintosh different types of files have different icons within
a window. So an Infocom game looks different than a Macwrite file or
some other application. Could someone tell me if it is possible to
create a custom icon for an application? Or is one limited to the

pads and folders?

I'll second that !! Alternatively, does Atari UK have a bulletin board,
or does anyone over here know of any Atari BBS in the UK ??

[sorry if this is a duplicate message]

Hi-

Does anyone know how to get at the flinking environment string (like if you don't know what's already there in order to use SHEL_ENVRN)? What, if anything, is usually stored there? Who looks at the environment string (e.g., is there a PATH variable that maybe the silly COMMAND or silly BATCH programs use? (I somehow doubt it)).

I tried printing out the contents of memory at _base (which is set up in GEMSTART.O and company). It did not match up with either of the formats given in the CPM-68K documentation (one mentions environment strings, one doesn't --- and then there's the_envir, the system variable). Of course TOS is not, never was and never will be CPM-68K. Maybe I should dig up some MS-DOS documentation?

(I realize there are a couple of REGISTERED TRADEMARKS in the above. Please don't shoot.)

Also, who do I have to sleep with to get (C) source for a ramdisk (source for my own information, ramdisk because I need it)? Who decided that a C compiler with (effectively (?)) 7-character identifiers was fit to be seen in public (/real/ programmers . . .)?

Ok., so I'm culturally deprived -- what's a :-) and how do I keep them away from innocent bystanders? And which is better --- /emphasis/ or *emphasis*? I haven't been so distressed since I didn't know which fork to use . . .

After hearing all of the bad things about the old 520ST power supplies
(with the cords coming out of opposite ends) I am considering buying a
new one.

How much, and from whom?

Thanks in advance,

Eric Bergman-Terrell

I don't see why UNIX machines should be expected to pay for distributing
software and discussions for other operating systems. Why can't they
set up their own network? Disk space and phone lines aren't free for
machines that run UNIX anymore than they are for machines that run
mac/amiga/ST/PC-DOS/VMS/whatever.

(Before someone mentions groups like net.cooks, consider the difficulties
of connecting a modem to your average saucepan.)

It seems to me that most BBSs that I hook into allow 1hr connect time. However, these BBSs are so busy that it is virtually impossible to get on except between 3:00-5:00AM weekdays and 3:00-9:00AM weekends (EST). Obviously the demand for file transmission has exceeded resource capacity. Hence an alternative is desperately needed. The net is a great alternative in many ways. I think it should be utilized immediately for this purpose. Realizing, however, that there are valid concerns regarding too much software being put on the net I think that certain restrictions should be imposed on source/binary transmission. Exactly what the optimal formula is I don't know but it probably should involve a combination of file length and number of transmissions per week. I would be very happy if everyone could agree on such a formula because, in my mind, the result would be a much more useful net. While I am here let me propose a formula for binaries: Let U(P) denote the number of storage units used by program P. Let S(P) be the size of a file in kbytes. Define U(P) as

U(P)=S(P) DIV 8

I propose that the total numbers of storage units transmitted over the net per week be less than 8. Net users would be asked not to transmit any more units of data until the number of units transmitted over the previous two week period fell below 16. I am not making any great claims for this proposal...I am just throwing it out for purposes of generating discussion.

By the way - don't ask me for any BBS numbers...if any more people find out about these numbers I will not be able to get on even saturday morning at 5:00AM (EST).

horse puckey! first who said that the free (read 'uncensored')
exchange of ideas was free (read 'without cost')? it ain't
second, you have a right to censored what you recieve at your
machine but not what passes thru it. the system i am building
based on email, hence if you are not a newsfeed you bear none of the
costs, if on the other hand you are a newsfeed to others then you
have given your implicit consent to bear the costs of a newsfeed.

The original request was for E-mail, not for a posting to the net.
I don't think that there would be much objection to a net posting
of the material in question, since it would probably be useful to
many people, perhaps even some who pay the costs.

/* This routine does a lot.  It probably could have been done easier
by direct assignment to the structure, but standard system calls never
hurt. (gag) It opens a dialog box into our window, then does a form_do,
indicating one editable field, which makes it wait for something to
happen.  Then it does whatever the return code tells it.  I tried for
the longest time to get the fmd_finish to erase the dialog, but it
doesn't.  It merely pipes a message, you have to do a redraw manually!!
Which means you better know VDI.  I cheated by getting rid of the whole
window, in this way it has to redraw the desktop, automatically. */

Hello,
        I would like to know is there anymodem program for either 16
and 8 bits that support keypad full screen mode?? I need it so bady and
I can't find anywhere, I have ST-Term, STerminal and Chat but it don't
work with Keypad. Please respond and help me...

I'd like to know the meaning of the information that is stored at the
beginning of a TOS executable file.

```
address         data            meaning

0000            60 1A           BRA $001C       ;branch over fields
0002            00 00 7E EC     length of file?
0006            00 00 00 00     ?
000A            00 02 25 04     ?
000E            00 00 00 00     ?
0012            00 00 00 00     ?
0016            00 00 00 00     ?
001A            00 00           ?
001C                                            ;begin of actual program
```

What do the several fields mean? Are they absolutely necessary or are
they just information for programs like debuggers and the like? Any
information greatly appreciated.

BTW, does anybody have a PD disassembler? Could someone mail it to me?

Thanx,

Summary: Source and executable for 50 line screen

Here are the small programs for the monochrome system that give 50 lines
and 25 lines. Also in response to the mouse controls in micro-emacs
you'll notice that the cursor keys work in micro-emacs. You can write a small
program that changes the mouse such that it outputs the cursor keys...
thus the mouse works in micro-emacs. It's a bios or xbios call, I'm
sorry I haven't got the code handy right now. Also I have a micro-emacs
with the features we've added, but I'm not sure if current versions have them.
They are:

    -query-replace (ESC q)
    -Cntl x Cntl v works properly (create a second window and bring in
     the file all at once)
    -The editor works in 50 line mode
    - ESC w (like cntl W but just makes a copy)
    - ESC g (goto line)
    - Cntl x Cntl f works
    -others I can't remember- mostly the commands resemble EMACS commands

If this oldhat sorry for the waste of space, otherwise I guess I could
post the executable (the source is in complete shabbles right now)

Posted now are both source and executable for the 50/25 lines per screen.

When I double-click on a source-file and then choose the option
print then the symbols { } [and] are not printed correctly.
My printer is supposed to be Epson-compatible. (Nakajima 2200).
This problem is especially annoying with C-sources. First Word
does print the symbols correctly.
My question is: does anybody know how to get to the printer
character-table, so that I can put a program in the AUTO-folder
that changes the charactercodes?

Can someone tell me if I buy a 520ST with the DS disk drives, will I
be able to read/write SS disks too? Or must I get both drives in order
to read/write both types? And what format is most prevalent? Thanx.

I'm going to be coauthoring a book this summer about graphics and C
on the ST and Amiga -- introducing C through graphics and moving on
to an introduction to device-independent code for 3d graphics. I've
ordered the Developer's Kit for my 1040, but I'd like to be able to
discuss and/or recommend other compilers too.

I know that DRI, Lattice, MegaMax, Habba, and Manx all have compilers
either released or in beta test. Are there any others that anyone
out there has heard of? Is it possible to get Greenhills for the
Atari (as opposed to downloading your object code from a Sun or some
such)? What is "GST", which I have heard mentioned once or twice?

Once I get my hands on these compilers, I'll run some fairly comprehensive
benchmarks (starting with Dhrystone 1.1) and post the results. Let
me know of any other ST compilers, or any good/bad experiences with
the ones above, and I'll be very grateful. Thanks!

I couldn't fail not to agree that anything other than that which isn't the
failure of his absence to leave couldn't do otherwise than make me happy.

>0x12?

0x12, or what ever 0x is, the 12 is a decimal equivalent for ACSII FF, of
formfeed. And it seems reasonable that the BBS's do send a form feed just
proir to dumping screens full of data to a remote site. My two cents.

Has anyone ever seen or used an encoding or compression algorithm
to store image files? I have seen a couple of demos which appear
to be compressed, as they are all different sizes and come up in
a "slideshow" style presentation.

I would be interested in receiving any details regarding sources,
implementation, etc. which you might have.

BTW - good JOB! out there in Sunnyvale - an excellent product.

I've been enjoying my 520 now for about two months, spending my time making
a Mandelbrot demo to learn GEM and VDI. The demo is flashy in that it gives
a full-screen low resolution picture quickly, with the resolution increasing
as you watch. I'll post it when its done.

After using the developers kit for a while, I've cataloged my impressions
in the form of a wish-list of desireable software improvements. If you have
found programs with the desired functionality, or if you have
found work-arounds to like problems, please share the wealth.

Being an engineer, and also an engineer at heart, I usually spend most of
my time worying about the parts of the system that don't work. However
least one get the wrong impression, most of the ST software I have does work.
I recommend ST as a viable entry, and quite an echonomical one at that.
Especially when one considers the public domain software to hack with.
But now for the wishes:

1. Link68 seems to not know about absolute pathnames. I like to keep directories
small, but to get it to work, libraries and applications must be mashed
together. Does anybody have any magic (besides moveing default files
to RAMDISK) ?

2. If anyone has done a comparison of MAKE's please send your
findings out the net.

3. Has anybody integrated mouse pointing into Micro-Emacs? T'would be
nice.

4. And Search Rules for the compiler! Do they exist? I hate putting absolute
pathnames in my sources, but hate moby folders that take the whole screen
even more.

5. If anybody has a Copy.TTP and/or Move.TTP, please post them. Perhaps
they exist in some repository which I haven't found. Or I could just
write them, but ...

6. It seems that Application Document types are known system-wide, but
the application handlers themselves must be in the current folder.
Also, I often want one application handler (e.g. micro-emacs) be
in effect for multiple document types (e.g. source.c and source.s).

7. Is there an option to save the desktop before an application starts
so that exiting the application and returning to the desk wouldn't involve
spinning the disk? Perhaps pickey, but it takes a few seconds
and happens quite often. Perhaps the Moby RAMDISK is the way out.

8. My friend made me extremely gealous over lunch the other day quoting
how his Thinkware C on a MAC+ did a compile-bind-go in 10 seconds. I'm
struggeling with a 90 second compile and a 5 minute load using the developers
kit. (I guess GEM libraries are big.) I know that both are about 5x faster
using RAMDISK, but I need more memory on my 520 to fit everything.

9. My warantee will be up in a month, and I'm going to get the old soldering
iron out. Does anybody have any experience with putting in 1M chips?
Does the ST's MMU handle them? (it seems to have pins enough, what about
refresh? (Neil?)) I believe it would require flying wires on a few address
lines, but no piggybacking. The thought of doing compiles and links from
a 1.5M RAMDISK really turns me on!

10. I'm looking for a set of graphics primitives that will make porting
my pet children's game to other PC's as well as the ST easy. Does GEM
foot that bill? How stiff would lisence fees be for customers
who didn't already have GEM, given the package wouldn't expose bare GEM

functionality to the user. Anybody know of other packages or conventions
that work?

11. Boy, would I like to have a copy of Switcher to go quickly between
contexts quickly. What I'd really rather have is multiprocess windows
like the Sun, but lets be realistic! Two practical questions though:
Is it possible to bring up a GEM application on the same desktop
as (using MAC terms) the finder? and Does GEM support any sort of
multi-tasking? Does any one out there have any hints?

"You can tell a craftsman by his tools",
         and
     "the men from the boys by the size of their toys".

Hello,
        I would like to know is there any modem program for either 16
or 8 bits that would support keypad for full screen mode?? just like
VT100, I know vt52 don't work with that problem. I have Chat, ST-talk and
STerminal but they don't work with keypad support. If you know any program
or suggest, please respond, I need it badly, more that you can imaged!
 mail back to me or
leave mail in GEnie my mail address is J.T.Lytle
                          Thanks,
                             John Lytle

Hello,
        I would like to know is there any modem program for either 16
or 8 bits that would support keypad for full screen mode?? just like
VT100, I know vt52 don't work with that problem. I have Chat, ST-talk and
STerminal but they don't work with keypad support. If you know any program
or suggest, please respond, I need it badly, more that you can imaged!
 mail back to me or
leave mail in GEnie my mail address is J.T.Lytle
                          Thanks,
                             John Lytle
                             NTID/RIT

Unfortunately, most of the companies selling languages saying you have full access to GEM are TELLING FIBS !!!

Firstly, you need an RSC file editor - these are not supplied by most of the companies and are needed to sort out the data for the pull down menus etc. The only places I have seen this is in the DRI dev kit (if you have $300) and with the MEGAMAX at about $200.

Secondly, to make a program an acc instead of a normal program one must link it with a different startup routine, again not usualy supplied - and as TDI use their own linker (not the usual DEV kit or GST compatible ones) you cant even do it if you have the startup files from somewhere else.

Perhaps if we all write to all the companies selling languages that claim full gem support but do not give it, we MIGHT get some action.

From a very annoyed user of TDI Modula 2, Metacomco Pascal and GST C.

Some people seem to get their facts twisted.

There seem to be two problems
1) Some of the older power supplies cannot supply enough power if you have
the extra 16 ram chips to give 1 meg (my one is black with a lead out of
each end, ive been using it for a month since the 1 meg upgrade and rom upgrade
which i had done at the same time)
2) With twice as many ram chips, the MMU must do extra work   holding the
inputs to the ram chips at their normal voltage. The resisters are therefore
pull ups and do this job instead.

Summary: How to get it

I've found that my 1040 runs at a reasonable temperature when
it's not doing anything in particular. But if you do disk copies for
a couple of hours, then you notice the melting. If I weren't hopping
onto a plane very soon to go to the radioactive terrorist jungle
called Europe, I'd write a quick demo program to do lots of
intensive copying to test the point. Would anyone care to write
a short program to copy a disk back and forth, and post it to
this net group?
.......ak.

I have made a reply elsewhere with respect to this, but this article prompted
me further.

Why did your computer not blow at first ? This is simple. If a component is

being driven too hard (the extra power drawn by extra roms) then, it may cope apparently ok for a bit before the extra stress on the component forces it to pack up.

My first ST was purchased last september. At Xmas it packed up - it was working ok, I turned it off, had lunc, turned it back on and it just came up blank. Silica Shop (the major british supplier) replaced it (after a bit of a tussle). (just the keyboard that is)
In april I had the 1 meg ram upgrade done for me (with the resisters) and roms finished. My machine is still ok despite the power supply being the origanal september one and my machine having to stand being moved to and from university often on a motorcycle.

One interesting point was that the replacement (and it was definately not MY one repaired) had obviously been 'fiddled' with as the people that did the ram upgrade said that a couple of the ram chips on the board had been replaced and some chips had been resoldered. Sujesting it was a blown and repairred replacement - even though they sent it out with a new set of manuals, disks, and mouse (so I have two sets of these)

Lines: 44

From the Rock'n'Roll city --

Product: DOS Shell
Developer: MichTron, Inc.
Address: 576 S. Telegraph, Pontiac, Michigan 48053
Phone: (313) 334-5700
Price: $39.95 (list) $25.00 (discount)

This program is an MS-DOS shell. Supported commands are ? (help,)
cls, chkdsk, date, time, ver, verify, path, run (to start GEM
programs), exit, dir, copy, del, rename, type, chdir, mkdir, rmdir,
path, tree, vol, prompt and set. Batch files are supported with
the commands echo, goto, if, pause, remark and shift. Batch command
file arguments are permitted using the "%1 %2 ..." convention.
Conditions allowed in a batch if command are errorlevel, string
equality and file existence. Conditions may also be negated. I/O
redirection and filters are supported. Pipes are constructed from
intermediate files (of course.) Three special filters (more, sort
and find) are provided.

Search paths and prompts are easily changed. The command line interpreter
expands * and ? properly as file wild cards. The set command permits
abbreviations. An abbreviation must be preceded by a percent sign when
used, thus limiting the use of abbreviations for the creation of command
aliases. All abbreviations must fit into a 1K string buffer.
People who are used to typing "ls," "cp" or "mv" are in trouble
here and may have to define batch file equivalents. At least AUTOEXEC.BAT
is available to define all this stuff when DOS Shell is started from
the GEM desktop.

The program seems to work as advertised. Since DOS Shell resides on TOS,
some surprising differences from MS-DOS may be expected. I wish that
"ls," "cp" and "mv" were handled as acceptable command abbreviations.
Documentation is fair to good. A little familiarity with MS-DOS
is helpful as a few details get lost in the cracks.
The diskette is NOT copy protected. Since most of the programmers
at MichTron are students working their way through college, I would
recommend buying a copy. At $25 (discounted price) I received good

value. Further, DOS Shell will be supported by MichTron while public
domain shells may go unsupported.

To: decvax!decwrl!imagen!turner
Subject: Format of '.prg' files
Cc: decwrl!bammi

     I extracted the following info. from documents that came
with the development system. I have only found the .prg (output
of relmod) format, and not the .o format. The input of
relmod is the standard cp/m-68K relocatable files, so I
guess the .o format is the same as for cp/m-68K. I am not at
all familiar with cp/m-68K, and i could not find anyting in the
documents I have about the format of .o files. Maybe you are
familiar with cp/m-68k or have access to the relevant cp/m-68k
documents. Looking forward to your PD diss assmebler.

The format for a .prg file is as Follows (word = 16 bits). Output of
relmod - 16 bit relocatable objects are not supported by Gem Dos.

     14 Word Header

```
     Text Segment Image
     Data Segment Image
     Symbol Table (Optional)
     Relocation Info (Optional)

Header Format:
     Byte Size(words)   Contents
     0    1        Contains 601A H Denoting Contiguous
                   text, data and block storage segments
     2    2        Size of Text Segment - Bytes
     6    2        Size of Data Segment - Bytes
     10   2        Size of Block Storage Segment - Bytes
     14   2        Size of Symbol Table - Bytes
     18   2        Reserved - Always Zero
     22   2        Reserved - Always Zero
                   (This is supposed to contain the
                   Begining of the Text Segment and
                   execution, but execution always begins
                   at the top of the Text segement, hence 0)
     26   1        If Zero then Relocation info IS
                   present, No relocation info otherwise.
                   Always Zero for Gem Dos.

Symbol Table Format:
     Each entry is 7 words.

     Byte Size(words)   Contents
     0    4        Name - zero padded to 8 characters
     8    1        Type
     10   2        Value

     Type          Value
     defined            8000 H
     equated       4000 H
     global        2000 H
     equated register   1000 H
     external reference  800 H
     data based reloc.   400 H
     text based reloc.   200 H
     bss  based reloc.   100 H

     where:
       reloc. == relocatable

     A symbol with multiple characteristics has the bits OR'ed in
the type field.

     The value field is the value of the symbol (address, register
number, value of an expression or some other value). When the value
field is non-zero AND the type field contains an External Symbol, the
linker interprets the value to be a common region in which the size of
```

the region is the value in the value field. Multiple such entries may be present and the size of the common that the linker ultimately decides on, is the greatest of the values, of the same name.

The nm68 utility provided with the development system can be used to dump the symbol table.

Relocation Information:

If the last word in the header is Zero the relocation info is present in the following format: (following symbol table if present)

Byte	Size (BYTES)	Contents
0	4	Offset from the beginning of the Text Segment of the first longword needing relocation.
4	1	Relocation offset byte
5	1	" " "
.....		
xx	1	A byte containing Zero terminates

Relocation offset byte - Gives the offset to the Next longword in the Text Segment to relocate (offset from the First Offset) and so on. When an offset of Zero is encountered the relocation info is terminated. The bytes of Relocation offset give succeeding offsets. (so the smallest legal value is 4 (size of long word)). If a succeeding offset is greater than 254, then a byte containg One (1) will be encountered, signifying add 254 to the previous total.

I hope that I explained the above clearly. I guess an example is appropriate to say what i mean.

Suppose that the first longword to be relocated is at offset 128 from the begining of the text segment. The next one is at offset 132 from the begining. The next is at offset 390 from the begining of the text segment (ie. 258 bytes from the second longword to be relocated), Then the relocation info looks like

byte	Size(BYTES)	Contents
0	4	128
4	1	4
5	1	1 (add 254)
6	1	4 (128 + 4 + 254 + 4 = 390)

and so on.

I hope the above info help.

Seasons Greetings

>the 520 isn't so easy due to the lack of space inside the case.

Here in Europe it is an official Atari policy to sell four types of ST-models
which are: 260ST, 520ST, 520ST+, and 1040ST. Leaving aside the 260-model, the
following is a comparison of the remaining three models:

model	characteristics	price relative to 520ST
520ST	including SS-drive	f 2500 or about $1000
520ST+	same as 520ST but 1Mbyte of memory	520ST + 15%
520ST+	DS-drive instead of SS-drive	520ST + 23%

1040ST (built in DS-drive)   520ST + 40%

It is astonishing that Atari apparently does not support the 520ST+ model in the States while they do support these models on our side of the great pool. The 520ST+ model is really a good compromise if you want both modularity and less vulnerability to problems and on the other hand 1Mbyte of memory. Why don't you (in the States) push Atari to support the 520ST+ model in the States as they do in Europe?

Frans Dorrestein.

The next few postings are for a checkers program (named cadenza) that I have written. The postings will include the source for the program (in OSS Pascal), the uuencoded binary, and the rules for checkers.

The program must be able to write to the disk that it is saved on since it writes a file recording all moves of a game to the disk.

Be sure to read the rules carefully. Most people who haven't played checkers for a few years have forgotten some of them.

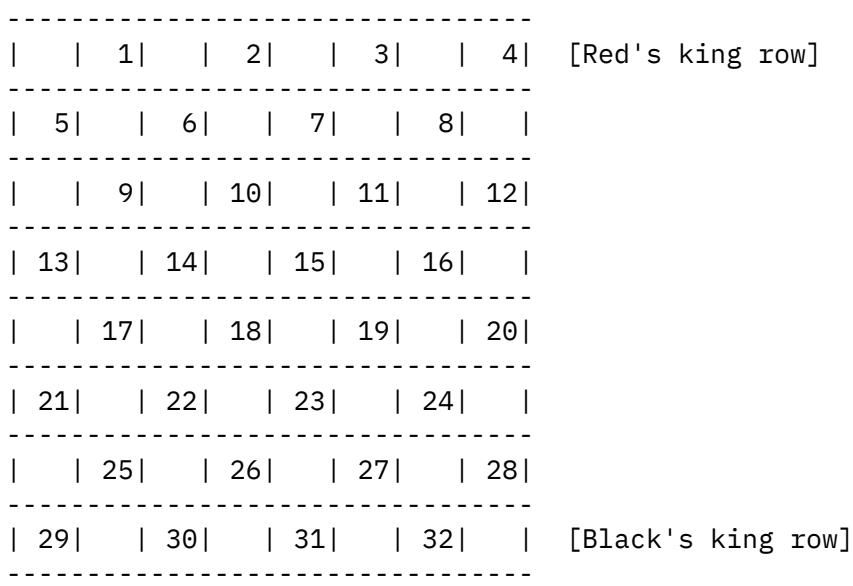
_T_h_e _R_u_l_e_s _o_f _C_h_e_c_k_e_r_s:

Squares on the checkerboard are numbered as follows:

TOP



BOTTOM

_M_o_v_i_n_g _t_h_e _p_i_e_c_e_s:

Black makes the first move, and players alternate until the game is over. A player must make a move if possible i.e. he may not pass. A move is either a simple move or a capture. A simple move for a black piece is a move to an empty adjacent diagonal square in the downward direction. A simple move for a red piece is a move to an empty adjacent diagonal square in the upward direction. If a piece makes it to the opposite end of the board (its king row) it is crowned and may move to any of the four squares adjacent to it that are empty.

_C_a_p_t_u_r_i_n_g:

A piece or a king captures in the same direction that it

moves. A capture is possible when one's piece or king can jump over an enemy piece placed in a square that otherwise the capturing piece or king could move to, and land on an empty square on the diagonal immediately beyond the jumped - over enemy piece. A captured piece is removed from the board. If after a capture the capturing piece is eligible to capture another piece, it must. The only exception to this rule is when a piece makes a capture and is thereby crowned - then it must wait for the next turn before capturing again. In general, whenever there is at least one capture available to a player during his turn, he MUST make one of the captures.

_W_i_n_n_i_n_g:

The game is over when during his turn a player cannot move (either because all of his pieces have been captured or because he cannot legally move his remaining pieces). This player is the loser of the game.

_P_l_a_y_i_n_g _t_h_e _C_o_m_p_u_t_e_r _G_a_m_e:

As your pieces are black, you will be making the first move of the game. Black pieces, black kings, red pieces, and red kings are represented by "b", "B", "r", "R", respectively. To the right of the game board is a numbered board. To make a move one enters the number of the square to be moved from followed by the number of the square to be moved to. Cheating is not allowed, so moves will be accepted until a legal one is entered. The game ends when either player wins, or when the human player's patience is exhausted. A record of the game (in standard checkers notation) is stored in a file named gamerec.txt.

  I am looking for a good atari dealer in the Maryland or Washington
D.C. area (within about 40 miles). I haven't seen too many that sell
```

(let alone service) the 520's or 1040's. Any help would be greatly
appreciated.

Because there is a large base of users of those machines that happen to be
using Unix machines to communicate. The reality is that USENET hasn't been
a unix network for a long time, just a network that uses Unix. If you're
serious about limiting yourself to Unix discussions, we need to kill everything
else off except Unix, which would kill the net.

     I don't see why educational computer installations should pay
for the distribution and development of Unix system. Perhaps it would
be better if they limited their transmissions to library catalogues
and lecture schedules. Surely nothing more than that can be justified.

Cheers! -- Jim O.

I ported u-emacs V30 to the ST using the Lattice compiler with little trouble.
I also included "shell escapes" (you can run make etc. from emacs) and
a couple of nice things like "cd" and "pwd"
If anybody wants it I could post it out (uuencoded?)

In the last newsletter I received from the Atari Group in Rochester. (A.C.O.R.N.) it mentioned that:
" Software Punch of Liverpool, U.K. is working on an Ethernet-compatable networkk of cables that allow ST computers to share information."

What protocol levels they intend to support I have no idea.
{John}

In response to someones query about the desktop.inf.... tah dah -----
Everything you always wanted to know about desktop.inf, but were afraid to ask. Below is a typical desktop.inf file (with a few changes added for examples). Below each line is a definition of what each value represents.

#a000100
This is the first desk accessory, the rs232 config. Each 0 represents the first column of buttons on the set rs232 config dialog box. The first 0 is column 1 row 1, the second 0 is coumn 1 row 2, etc. A 1 value indicates that a button in the second column was chosen.

#b000000
This is the set printer config. It works the same way as the rs232 config.

#c777000700060007005520050555222077055707505550770311110 3

This is the color palette. The color value is set using 3 digits at a time, representing the red, green and blue values. The 3111103 at the end deals with the keyboard repeat rate, and sensitivity. (None of the above three will do anything if the associated desk accessory is not loaded)

#d
This is apparently reserved for a fourth accessory, and does nothing at this time (so far as I can see).

#E C4 02   (#E=Extras)
This is two things. The first value has to do with both the Set Preference dialog and the mouse double click rate. The byte is broken down as follows with the indicated bit set performing the noted action:

```
Bit       7       6       5       4       3    |   2       1        0
Value    128     64      32      16       8    |   4       2        1
     displays  sorted  sorted  confirm confirm |   double click rate
       TEXT      by      by    deletes copies  |   all three bits, values
   (if not set  size    date                   |   may only be from 0-4
     displays    \       /                     |   5-7 will turn off the
      icons)     both bits                     |   mouse buttons
                  sort by
                   type
```

If neither bit 5 or 6 is set the sort is by name

The second value is 03 for hi rez, 02 for medium rez, or 01 for low rez.

#W 00 00 02 0B 2A 0B 08 A:*.*@   (#W=Window)
#W 00 01 0A 01 45 09 08 A:\TEST.C*.*@
#W 00 00 0E 09 2A 0B 08 A:*.INF@
#W 00 00 0F 0A 2A 0B 00 @
The above four are the window defs. The first number is how far over the horizontal slider is, the second is the vertical slider. The third number is the x coordinate of the left hand side of the window (this takes on even values, with odd values the same as next lowest even value). The fourth number is the y coordinate (this takes single increments). The fifth and sixth numbers are the width and height, respectively. The last number indicates where on the screen the window will open from. (The window opens with a different shape and from a different place with each number, but when you close the window, it will go to another place on the screen. I have not hacked at this long enuf to figure it out.) A zero or FF will not open the window. The text indicates which drive's contents will be displayed. If the drive does not exist, the window won't open, ie. drive bits not set. Also, if the display validation is omitted, the window won't open.
The second def above will display the contents of the folder TEST.C, while The third def above will open a window, and only display the .INF files on drive A. If you close and open the window, the files will display as defined in the file and program defs below. (NOTE: this only applies to icon images, every file will display in text -- except if the file bits are marked to be hidden, system, volume, read/write and whatever other bits there are, in which case it won't display at all, but if it is read only, it will display -- strange HUH?) The bottom-most open window in

the list will be the active window.

#M 00 02 00 FF D FLOPPY DISK@ @   (#M=iMage (?))
#M 00 00 00 FF A DRIVE A@ @
#M 00 01 00 FF B FLOPPY DISK@ @
These describe the icon attributes. The first two numbers are the column and row position of the icon. The column can be from 0-7, the row 0-3. The third number determines the icon image which will be displayed. The image number is the same for this and the remaining defs in desktop.inf, as follows:

0= disk drive (drawer)   1= folder (sub-directory)   2= trash can
3= executable file (.PRG, .TOS, or .TTP)   4= text (stack of papers)

The fourth value doesn't seem to do anything, but must be a place holder for an unimplemented function. The single letter is the drive identifier, and the text is the drive name. The first @ indicates the end of the drive name. The second @ does nothing, but we can speculate as described below for the file identifiers. The order in the list determines the visual heirarchy of the icons, ie. which will display on top when moved over another icon.

#T 00 03 02 FF   BLACK HOLE@ @   (#T=Trash)
This is the same as the disk drive. If you move a disk drive identifier below this in the list, it will display on top of the trash if moved to the same location. The trash has no identifier letter, but you can put one in.

#F 03 04   @ *.INF@   (#F=Files)
#D FF 01   @ *.C@   (#D=Directories)
These two determine which type of file or directory will be displayed, when displayed as icons. The first line will make GEM display only .INF files for use with the SHOW, PRINT, CANCEL alert box. If you delete this line, no icons will be shown for any file, except as defined below for programs. The second line does the same for sub-directories, only .C folder icons will show. When files are displayed as text, all files will be there, but if you single click on an 'undefined' file type, the sytem will reboot. If you double click, the name will be highlighted, but you can't do anything.

#G 03 FF   *.APP@ @   (#G=Gem)
#G 03 FF   *.PRG@ @
#F 02 04   *.TOS@ @   (#F=File)
#P 03 04   *.TTP@ @   (#P=Parameters)
The above four determine the types of files defined as executable images. Notice that the #F, #D, #G and #P all have two @ symbols. This is defined as: the text before the first @ tells GEM this is a def for an executable file, while text after the first @ and before the second @ tells GEM that this is a def for a SHOWable file (ASCII or object). Note that if both are specified, like   #G 03 04   1ST_WORD.PRG@ *.TXT@   then when you double click on any .TXT file, the 1ST_WORD.PRG file will run, and the .TXT file will be taken as a parameter.
The first number indicates the icon image for the file before the first @, and the second number indicates the icon image for the file between the @'s.

Note that the disk drive def also has two @, which would indicate that the

FF is a def for the text in between the @'s, but I couldn't get anything
to happen.
Try playing around with your desktop.inf by placing different values for the
icon images (can be kinda fun). Be forewarned, tho, you can thoroughly
confuse GEM, although no harm will result.

This concludes the desktop.inf tutorial (for disk based desktop.inf, there
are a couple of desktop.inf's in memory which can do things, too).
There may be more to it, but I haven't figured it out yet.

From Houston,
Michael Vederman

** Information File on Philon/Fast Basic-M compiler (V1.3) **

I have just purchased the above named compiler, and after looking over the documentation, I think those (few?) of you who program in Basic like myself would be interested in some information about the package.

First of all, be aware that this compiler requires either two disk drives or (preferably) a hard disk. The reason for this is that the system comes on five (!) disks, four of which must be switched into-and-out-of the 'B' drive during the compilation process.

I can't give a review of the software proper, as I do not yet have the necessary second disk drive yet. (Donations, please? ;-))

The biggest complaint I have is that the licensing agreement that comes with the package is incredibly restrictive. Unlike the Good Folks at OSS, who make the Personal Pascal package for the ST, Philon does not let you sell license, or give away any program that has their runtime library included. Obviously, this would be defined as any program compiled with the package.

I find this unacceptable, especially considering this is *Basic*.

I also got a chuckle from one paticular line in the license agreement: "Customer agrees to take reasonable steps to protect the Philon Software from theft or use contrary to this license." Guess I gotta buy a safe now!

Comments folks?

I would not be surprised if the BBS tries to send a CTRL Q at the start of
an ASCII transmission. But wouldn't that be a 0x11? Strange... Anyhow,
if it works, don't argue, right?

You're welcome! Now if only someone would come up with a way to get 4 (or
even 8) phone lines into 1 ST, with appropriate BBS software, then we
wouldn't have to do so much work...

By the way, has anyone come up with a uuencode program that runs on the ST
yet? What are you waiting for?

> Neil, if you're out there, could you comment or elaborate?

The SH204 20-megabyte hard disk is scheduled to ship late in May at a
suggested retail price of $799.

The CP/M emulator is a software product that will be less that $50. It
should be in stores shortly.

The MSDOS emulator is a hardware add-on that is not yet ready to ship (or to
even discuss the firm specs for). We predict availability this Fall.

The SMM804 dot matrix printer is the same one that was discussed in the
April/May 1985 issue of Atari Explorer. It is an 80-cps, 80-column,
parallel interface printer compatible with the Epson graftrax protocol, with
some ST-specific additions. It is selling for $229 and is available now.

The Atari blank disks are certified double sided 3.5 inch diskettes with
Atari labels. A box of 5 sells for $16.95.

On the Atari Corp. BBS (408-745-5308) in SIG #7 (ST Art), you will find two
programs -- a squeezer and an unsqueezer. We squeeze all pictures on the
BBS to help save downloading time (disk space also, but we still have more
than half the 20-meg free -- god I love hard drives!).

> BTW - good JOB! out there in Sunnyvale - an excellent product.

Thanks! I wouldn't be without it myself.

Dwight,

Thanks for your letter. Alas, I do not have access to Compuserve.
Perhaps you could send me a copy of the source for your desk accessory
when you're finished with it?

Thanks,

Eric Bergman-Terrell (CSNET ADDRESS terrell@ohio-state)

     The following statement is FALSE!!!!!!!!!!!!

>I agree in part, actually, Metacompco (sp?) wrote most of the graphics
>package, Amiga had to write the "Graphics BIOS", or drivers.
>

The Metacomco (correect spelling) people are talented, bright, and hard workers but they did NOT write one (1) line of graphics software for the Amiga. They wrote the file system and most of the CLI commands (DIR, LIST, COPY...) They did not write Intuition, Graphics, Layers, Audio, Serial, Workbench,.... Just the file system. We call this AmigaDOS. The 3 AmigaDOS manuals decsribe what they did. They did NOT do anything in the RKM.

OK. Thanks, just wanted to clear that up and give credit where credit is due. While I'm at it there are (Commodore) programers in Westchester, PA who have made significant contributions too.

I've had the Atari ST MODULA-2 (the first release) for a while now. *MY* dealings with TDI have been satisfactory. No hassle, no hype, few delays. They've even offered to help me demo their latest version to a local user's group by sending along some source/object code.

The worse I can say about TDI is that the first release was a bit buggy (aren't they all?) and the compiler shell badly needed paths.

However I've enjoyed the product and have ordered the developer's version of their latest release.

As for advertising a Mac version, well it could be that Pinnacle Ltd., TDI's parent company, made a goof.

Overall I'd recommend TDI.

You could certainly make Intuition calls from OS/9 just as easily as you
could from AmigaDOS. You'd have to rewrite some of the support functions
(like OpenLibrary()) to look for OS/9 style directories instead of AmigaDOS
logical names, but other than that they'd be little problem, I imagine.

I believe that TV modulators are available from places like Radio Shack for under $20.00. If you have a composite output, that plus a TV modulator will drive your TV. I suspect that a composite signal is present inside the 1040 since they originally planned to run a TV modulator with it. If not, it is possible to construct a composite signal from RGB using a "NTSC Encoder" chip like the Signetics TDA2501, but a nontrivial amount of design effort is involved. Also, it may be that the Pin 2 signal you found not to work with your TV set is inverted or has the wrong amplitude or something and could be fixed by a simple amplifier circuit.

Not being an ST owner yet, I must say I find Atari's performance on this issue less than confidence-inspiring. C'mon, you guys at Atari, AT LEAST you could APOLOGIZE for the inconvenience occasioned by your change of plan and perhaps offer a suggested means of dealing with the problem like buying Brand XYZ TV Modulator. Failing that, it might be appropriate to revise the owners' manual, don't you think? Of course after reading about the 1040 Cabinet Meltdown Syndrome, I doubt that I would chose the 1040 over the 520 at this point, anyway.

I had been waiting several weeks for my PD terminal program to arrive. When I heard about the Atari BBS, I could stand it no longer, deciding that I could write a simple terminal emulator with ASCII download capability pretty quickly myself. Well, Friday night I tried it. On my first attempt, none of the downloaded files would run, all giving "TOS Error 34" or something like that. I took out my trusty disk utility program and compared one of the downloaded programs with a program prepared locally. Well, it seemed that there was an extra byte at the start of every downloaded file that was pushing the remainder of the file off. Admittedly, I did not have a great deal of evidence supporting me, but I decided to try simply discarding out the extraneous byte. VOILA, working programs! I was actually so surprised myself that I very carefully looked through the code for my "terminal emulator" (including the compiler's assembly output) and it really seems that the errant character is comming from the BBS.

Anybody know what the garbage character is or why it is there (incidentally, the character seemed always to be 0x12)?

Other than that, I am really happy to have a hook into Atari for PD software. There are some really cute things available, and it was well worth the work. (I am especially pleased as I live in Mountain View, the next town over from Sunnyvale, so the phone call is cheap.)

Thank you Neil!

So, the plot thickens. That explains why my new TOS ROMs blew - perhaps. When I replaced the old 2 chips with 6 new ones, one (or more) of the new ones blew. And everything worked okay again with the old ones.

And at the time I thought logically that increased power drain meant lower voltage, and therefore lower current per chip. The note this note follows explains that actually a higher power drain means more current per device. I hope that this new engineering concept will be explained to novices like myself in due course. How can the MMU be blown by extra chips on the board???

Respectfully, ak.

Yes, there is an official line. At least, I got a line from an Atari hardware person. He told me that a check had been made and that this showed that the problems were very rare. The story I heard from a non-Atari individual last year was that 50% of supplies before September last year (ie produced before that time) were faulty to the extent of emitting smoke and giving a 15V difference between pins 1 and 7 on the supply instead of 5V. (Also giving a 35 mS pulse on boot-up.) But now the problems seem to be of three kinds:
(1) Too much voltage on the 5V line.
(2) Too much smoke from the "brick".
(3) Blowing the MMU when extra RAM is added.
Now the question may be asked whether these are mutually exlusive, or independent etc. My old supply had (1) but no (2). And I never tried (3).

The hardware person became merely sympathetic when I told him that the warranty had expired. But it was the TOS ROMs that made the problem evident, and they weren't available until it was too late. The thing I don't understand is why it took a week of using the TOS ROMs before one of these chips blew. Yet more mystery! If only this net had an automatic voting capability to indicate whether people had options (1), (2) or (3)!!

So long, Alan Kennington.
